The authors employ Mathematica to extend earlier work of Bailey, Borwein [743], and Plouffe, [824], done in 1995, but only just published, that discovered an amazing formula for π as is a power series in 16^{-k} , enabling any base-16 digit of π to be computed without knowledge of any prior digits. In this paper, Mathematica is used to find several simpler formulas having powers of 4^{-k} . They also note that it has been proven that their methods cannot be used to exhibit similar formulas in powers of 10^{-k} .
