ISSN 0003-049X (print), 2326-9243 (electronic). URL http://www.jstor.org/stable/984803. This paper, which immediately follows Benford’s [Ben38] in this journal issue, is reported in [LG78, p. 197] to have been of considerable interest to scientists involved in secret nuclear physics work in World War II. That is how Benford’s paper “in a journal of rather limited circulation and not usually read by mathematicians” came to be noticed by physicists.

[Lot26] Alfred J. Lotka. The frequency distribution of scientific productivity. *Journal of the Washington Academy of Sciences*, 16(12):317–323, June 19, 1926. CODEN JWASA3. ISSN 0043-0439. URL http://www.jstor.org/stable/24529203. This is the earliest known publication on the phenomenon known as Zipf’s Law, here applied to publication counts of chemists and physicists. Lotka’s Law (a term possibly first used in [Zip49]) says that the number of authors producing $n$ publications is about $1/n^2$ of the number producing only one. This ‘law’ seems to have been misunderstood and misapplied in other fields; see [Pot81].

George J. Stigler. The distribution of leading digits in statistical tables. Unpublished, but written about 1945–1946, and presented in an 1975 address at Haskell Hall, University of Chicago. Stigler’s distribution is more complex than that of Newcomb and Benford. Stigler has $F_d = (d \ln(d)−(d+1) \ln(d+1) + (1 + (10/9) \ln(10)))/9$, which gives leading-digit frequencies of 0.2413, 0.1832, 0.1455, 0.1174, 0.0950, 0.0764, 0.0605, 0.0465, and 0.0342. See [LCJ10] for a comparison of the Benford and Stigler distributions, and their relations to Zipf and Pareto distributions. For derivations of Stigler’s distribution, see [LG78, Rai85].
