H. A. Bethe, M. E. Rose, and L. P. Smith. The multiple scattering of electrons. *Proceedings of the American Philosophical Society*, 78(4):573–585, March 1938. CODEN PAPCAA. ISSN 0003-049X (print), 2326-9243 (electronic). URL http://www.jstor.org/stable/984803. This paper, which immediately follows Benford’s [Ben38] in this journal issue, is reported in [LG78, p. 197] to have been of considerable interest to scientists involved in secret nuclear physics work in World War II. That is how Benford’s paper “in a journal of rather limited circulation and not usually read by mathematicians” came to be noticed by physicists.

[Lot26] Alfred J. Lotka. The frequency distribution of scientific productivity. Journal of the Washington Academy of Sciences, 16 (12):317–323, June 19, 1926. CODEN JWASA3. ISSN 0043-0439. URL http://www.jstor.org/stable/24529203. This is the earliest known publication on the phenomenon known as Zipf’s Law, here applied to publication counts of chemists and
physicists. Lotka’s Law (a term possibly first used in [Zip49]) says that the number of authors producing $n$ publications is about $1/n^2$ of the number producing only one. This ‘law’ seems to have been misunderstood and misapplied in other fields; see [Pot81].

presented in an 1975 address at Haskell Hall, University of Chicago. Stigler’s distribution is more complex than that of Newcomb and Benford. Stigler has \( F_d = (d \ln(d) - (d+1) \ln(d+1)) + (1 + (10/9) \ln(10)) / 9 \), which gives leading-digit frequencies of 0.2413, 0.1832, 0.1455, 0.1174, 0.0950, 0.0764, 0.0605, 0.0465, and 0.0342. See [LCJ10] for a comparison of the Benford and Stigler distributions, and their relations to Zipf and Pareto distributions. For derivations of Stigler’s distribution, see [LG78, Rai85], 1945.
