This paper, which immediately follows Benford’s [Ben38] in this journal issue, is reported in [LG78, p. 197] to have been of considerable interest to scientists involved in secret nuclear physics work in World War II. That is how Benford’s paper “in a journal of rather limited circulation and not usually read by mathematicians” came to be noticed by physicists.

counts of chemists and physicists. Lotka's Law (a term possibly first used in [Zip49]) says that the number of authors producing \( n \) publications is about \( 1/n^2 \) of the number producing only one. This ‘law’ seems to have been misunderstood and misapplied in other fields; see [Pot81].

George J. Stigler. The distribution of leading digits in statistical tables. Unpublished, but written about 1945–1946, and presented in an 1975 address at Haskell Hall, University of Chicago. Stigler’s distribution is more complex than that of Newcomb and Benford. Stigler has $F_d = (d \ln(d) - (d+1) \ln(d+1) + (1 + (10/9) \ln(10))) / 9$, which gives leading-digit frequencies of 0.2413, 0.1832, 0.1455, 0.1174, 0.0950, 0.0764, 0.0605, 0.0465, and 0.0342. See [LCJ10] for a comparison of the Benford and Stigler distributions, and their relations to Zipf and Pareto distributions. For derivations of Stigler’s distribution,
