Edgar T. Irons. A syntax directed compiler for ALGOL 60.
Hash functions, for a key $x$ in a set $S$ of positive integers, of the form $h(x) = (C/(Dx + E)) \mod N$ are considered. Though the existence of $h$ is guaranteed, the scheme suffers from many practical problems because of exhaustive nature of the search for $h$.

Computing Reviews: “This short communication deals with a special kind of hash function called ‘Bloom filters.’ These filters are used, for example, to search a differential file containing updates to a main file.”.
