ISSN 0164-0925 (print), 1558-4593 (electronic). They proved that Byzantine agreement (the subject of Section ??) cannot be reached unless fewer than one-third of the processes are faulty. This result assumes that authen-
tication, i.e., the crypting of messages to make them unforgeable, is not used. With unforgeable messages, they show that the problem is solvable for any \( n \geq t > 0 \), where \( n \) is the total number of processes and \( t \) is the number of faulty processes.

Peterson presents a deterministic distributed algorithm for finding the largest of a set of n uniquely numbered processes in a ring. The algorithm requires \( O(n \log n) \) messages in the worst case, and is unidirectional. The number of processes is not initially known.
