ISSN 0164-0925 (print), 1558-4593 (electronic). They proved that Byzantine agreement (the subject of Section ??) cannot be reached unless fewer than one-third of the processes are faulty. This result assumes that authentication, i.e., the encrypting of messages to make them unforgeable, is not used. With unforgeable messages, they show that the problem is solvable for any \( n \geq t > 0 \), where \( n \) is the total number of processes and \( t \) is the number of faulty processes.

Peterson presents a deterministic distributed algorithm for finding the largest of a set of \(n\) uniquely numbered processes in a ring. The algorithm requires \(O(n \log n)\) messages in the worst case, and is unidirectional. The number of processes is not initially known.
