1 Introduction

Sometimes I happen to write macros and environments which don't care for the exact contents of an argument but only for that contents' typeset representation and its dimensions. In that case I personally dislike the fact that those arguments couldn't contain verbatim material if coded straight forward for macros. For environments this is quite easy to create thanks to lrbox, for macros this approach unfortunately doesn't work without the enduser's cooperation. Thus the macros distributed hereby came into existence.

This package provides \grabbox to grab an argument inside of a box. The used mechanism allows category code changes in that argument as long as it is used in a place allowing category code changes (so not inside of another argument).

It is written as a docstrip file: executing latex grabbox.dtx generates the grabbox.sty file and typesets this documentation; execute tex grabbox.dtx to only generate grabbox.sty.

2 Acknowledgement

I want to thank Enrico Gregorio for helping me develop first versions of the used mechanisms for the second iteration of my ducksay package. If he hadn't helped me back then, I wouldn't have considered the used method further – because the user interface would've been too clumsy and require strange markup like \foo arg} – and therefore this package wouldn't have been created.

Additionally I want to thank David Carlisle for helping me making \grabbox respect surrounding text colours.

3 The macro

\grabbox

```
\label{lem:condition} $$ \ \end{are} $$ \ \end{are} $$ \ \end{are} $$ \end{are} $$\end{are} $$\end{are} $$$ \end{are} $$
```

grabs the next braced argument and stores it inside of the box $\langle box\ register \rangle$. The box is of $\langle box\ type \rangle$, which should be one of $\langle box\ register \rangle$. The contents of the box except for $\langle inject\ pre\ pre \rangle$ and $\langle inject\ post \rangle$ will be contained in an additional level of grouping to ensure colour safety (similar to IATEX's $\langle box \rangle$). $\langle inject\ pre\ pre \rangle$ will be injected at the beginning of the box before this additional group is opened, $\langle inject\ pre \rangle$ will be injected at the beginning of the box and can affect its contents, $\langle inject\ post \rangle$ will be injected at the end of the box but can't be affected by stuff inside of $\langle inject\ pre \rangle$ or added content unless they are using global definitions – $\langle inject\ pre\ pre \rangle$ however can affect the contents of $\langle inject\ post \rangle$. Unless the $\langle * \rangle$ is given leading and trailing spaces will be stripped from the box. After the box is read in $\langle afterwards \rangle$ will be inserted. The complete contents of the box will be something like:

```
\langle \texttt{inject pre pre} \rangle \{ \texttt{\sct@color} \\ \langle \texttt{inject pre} \rangle \\ \langle \texttt{\sct@color} \\ \langle \texttt{\sctpre} \\ \texttt{\scpre} \rangle \} \\ \langle \texttt{\sctpre} \\ \texttt{\scpre} \\ \rangle \} \\ \langle \texttt{\sctpre} \\ \texttt{\scpre} \\ \rangle \} \\ \langle \texttt{\sctpre} \\ \rangle \\ \langle \texttt{\scpre} \\
```

All assignments are made local. Currently it is not safe to nest macros which use \grabbox. It should become safe if your macros use \grabbox inside of a group, so the inner \grabbox doesn't affect the outer one.

\grabbox uses \afterassignment and \aftergroup to do its magic. The former should be safe where it is used, the latter is used inside of the boxed argument before any contents are inserted.

Since \grabbox works by setting a boxregister using \setbox (and a bunch of temporary macros), it is of course not expandable and defined \protected.

4 Useless Example!

First we need to reserve us a box register for this example:

\newsavebox\ourbox

Next we define a macro which takes some arguments and uses \grabbox:

```
\newcommand\examplecmd[2]
    {%
    \begingroup
    \grabbox\ourbox[\itshape]\hbox[\sffamily is]{\examplecmdOut{#1}{#2}}
}
```

And we need our helper macro which is executed after \grabbox:

```
\newcommand\examplecmdOut[3]
{%
  \begin{tabular}[t]{@{}}ll@{}}
  Arg1: & #1\\
  Arg2: & #2\\
  Box: & \unhbox\ourbox\\
  Arg3: & #3
```

```
\end{tabular}%
\endgroup
}
```

The result is a macro that takes two ordinary arguments, after those a box in horizontal mode and finally another ordinary argument. If we use this macro we get the following:

Arg1: Hi,
Arg2: my
Box: \name is
Arg3: Steve!

One can see that sffamily is in (inject post) is not affected by the inject pre. The used code to generate that table was:

\examplecmd{Hi,}{my}{\verb|\name|}{Steve!}

5 Useful Example?

This example provides a macro which typesets its mandatory argument in a block of a definable number of lines, it is meant for a single paragraph.

As you can see, this macro uses \grabbox in a group delimited by \begingroup and \endgroup - like the useless example. It should therefore be safe to nest it inside other macros using \grabbox.

Finally a usage example of our new macro (with the duckuments package loaded):

```
\begin{center}
  \Rectangle[9]{\blindduck}
\end{center}
```

Results in:

There once was a very smart but sadly blind duck. When it was still a small duckling it was renowned for its good vision. But sadly as the duck grew older it caught a sickness which caused its eyesight to worsen. It became so bad, that the duck couldn't read the notes it once took containing much of inline math. Only displayed equations remained legible. That annoyed the smart duck, as it wasn't able to do its research any longer. It called for its underduckling and said: 'Go, find me the best eye ducktor there is. He shall heal me from my disease!'

6 Implementation
