Part I

siunitx — Overall set up

1 siunitx implementation

Start the DocStrip guards.

```
1 <*package>
    Identify the internal prefix (LATEX3 DocStrip convention).
2 <@=siunitx>
```

1.1 Initial set up

```
3 <*init>
    Set up a couple of commands in recent-ish LATEX 2ε releases.
4 \providecommand\DeclareRelease[3]{}
5 \providecommand\DeclareCurrentRelease[2]{}
    Allow rollback to version 2: if we need to, version 1 could eventually be added here
too.
```

```
6 \DeclareRelease{2}{2010-05-23}{siunitx-v2.sty}
7 \DeclareRelease{v2}{2010-05-23}{siunitx-v2.sty}
8 \DeclareCurrentRelease{}{2021-05-17}
```

```
    Load only the essential support (expl3) “up-front”, and only if required.
9 \@ifundefined{ExplFileDate}
10   {\RequirePackage{expl3}}
11   {}
```

Make sure that the version of l3kernel in use is sufficiently new. We use \ExplFileDate as \ifpackagelater doesn’t work for pre-loaded expl3 in the absence of the package.

```
12 \@ifl@t@r\ExplFileDate{2020-01-09}
13   {}
14   {%
15     \PackageError{siunitx}{Support package expl3 too old}
16     {%
17       You need to update your installation of the bundles 'l3kernel' and
18       'l3packages'.\MessageBreak
19       Loading~siunitx~will~abort!%
20     }%
21   \endinput
22   }%
```

Identify the package and give the over all version information.

```
23 \ProvidesExplPackage {siunitx} {2021-08-04} {3.0.24}
24   {A comprehensive (SI) units package}
```

1.2 Safety checks

`_siunitx_load_check:` There are a number of packages that are incompatible with siunitx as they cover the same concepts and in some cases define the same command names. These are all tested at the point of loading to try to trap issues, and a couple are also tested later as it’s possible for them to load without an obvious error if siunitx was loaded first.

```

25 \msg_new:nnnn { siunitx } { incompatible-package }
26   { Package~'#1'~incompatible. }
27   { The~#1~package~and~siunitx~are~incompatible. }
28 \cs_new_protected:Npn \__siunitx_load_check:n #1
29   {
30     \@ifpackageloaded {#1}
31       { \msg_error:nnx { siunitx } { incompatible-package } {#1} }
32       { }
33   }
34 \clist_map_function:nN
35   { SIunits , sistyle , unitsdef , fancyunits }
36   \__siunitx_load_check:n
37 \AtBeginDocument
38   {
39     \clist_map_function:nN { SIunits , sistyle }
40     \__siunitx_load_check:n
41   }

```

(End definition for __siunitx_load_check:.)

1.3 Provide a kernel command

`\IfFormatAtLeastTF` Not present in older kernels: use the L^AT_EX 2_ε mechanism as this is correct for this case.

```

42 \providecommand \IfFormatAtLeastTF { \@ifl@t@r \fmtversion }

```

(End definition for \IfFormatAtLeastTF. This function is documented on page ??.)

1.4 Top-level scratch space

`\l__siunitx_tmp_tl` Scratch space for the interfaces.

```

43 \tl_new:N \l__siunitx_tmp_tl

```

(End definition for \l__siunitx_tmp_tl.)

```

44 \</init>

```

```

45 \<*options>

```

1.5 Load time options

`\l__siunitx_column_type_tl`

```

46 \keys_define:nn { siunitx }
47   {
48     table-column-type .tl_set:N =
49       \l__siunitx_column_type_tl
50   }
51 \keys_set:nn { siunitx }
52   {
53     table-column-type = S
54   }

```

(End definition for \l__siunitx_column_type_tl.)

1.6 Option handling

```

55 \RequirePackage { l3keys2e }
56 \ProcessKeysOptions { siunitx }
57 \</options>

```

1.7 User interfaces

```

58 \<*interfaces>

```

The user interfaces are defined in terms of documented code-level ones. This is all done here, and will appear in the .sty file before the relevant code. Things could be re-arranged by DocStrip but there is no advantage.

User level interfaces are all created by xparse

```

59 \IfFormatAtLeastTF { 2020-10-01 }
60 { }
61 { \RequirePackage { xparse } }

```

1.7.1 Preamble commands

| | |
|--|---|
| <pre> \DeclareSIPower \DeclareSIPrefix \DeclareSIQualifier \DeclareSIUnit </pre> | <pre> Pass data to the code layer. 62 \NewDocumentCommand \DeclareSIPower { +m +m m } 63 { 64 \siunitx_declare_power:Nnn #1 #2 {#3} 65 } 66 \NewDocumentCommand \DeclareSIPrefix { +m m m } 67 { 68 \siunitx_declare_prefix:Nnn #1 {#3} {#2} 69 } 70 \NewDocumentCommand \DeclareSIQualifier { +m m m } 71 { 72 \siunitx_declare_qualifier:Nn #1 {#2} 73 } 74 \NewDocumentCommand \DeclareSIUnit { o +m m m } 75 { 76 \IfNoValueTF {#1} 77 { \siunitx_declare_unit:Nn #2 {#3} } 78 { \siunitx_declare_unit:Nnn #2 {#3} {#1} } 79 } </pre> |
|--|---|

(End definition for \DeclareSIPower and others. These functions are documented on page ??.)

1.7.2 Document commands

```

\qty
80 \@ifpackageloaded { physics }
81 {
82   \msg_new:nnn { siunitx } { physics-pkg }
83   {
84     Detected~the~"physics"~package: \\\
85     Omitting~definition~of~\token_to_str:N \qty.
86   }
87   \msg_warning:nn { siunitx } { physics-pkg }
88   \use_none:nnnn
89 }

```

```

90 { }
91 \NewDocumentCommand \qty { 0 { } } m > { \TrimSpaces } m }
92 {
93   \mode_leave_vertical:
94   \group_begin:
95     \siunitx_unit_options_apply:n {#3}
96     \keys_set:nn { siunitx } {#1}
97     \siunitx_quantity:nn {#2} {#3}
98   \group_end:
99 }

```

(End definition for \qty. This function is documented on page ??.)

\ang All of a standard form: start a paragraph (if required), set local key values, do the
\num formatting, print the result.

```

\unit 100 \NewDocumentCommand \ang { 0 { } } > { \SplitArgument { 2 } { ; } } m }
101 {
102   \mode_leave_vertical:
103   \group_begin:
104     \keys_set:nn { siunitx } {#1}
105     \_siunitx_angle:nnn #2
106   \group_end:
107 }
108 \NewDocumentCommand \num { 0 { } } m }
109 {
110   \mode_leave_vertical:
111   \group_begin:
112     \keys_set:nn { siunitx } {#1}
113     \siunitx_number_format:nN {#2} \l__siunitx_tmp_tl
114     \siunitx_print_number:V \l__siunitx_tmp_tl
115   \group_end:
116 }
117 \@ifpackageloaded { units }
118 {
119   \msg_new:nnn { siunitx } { units-pkg }
120   {
121     Detected~the~"units"~package: \\\
122     Omitting~definition~of~\token_to_str:N \unit.
123   }
124   \msg_warning:nn { siunitx } { units-pkg }
125   \use_none:nnnn
126 }
127 { }
128 \NewDocumentCommand \unit { 0 { } } > { \TrimSpaces } m }
129 {
130   \mode_leave_vertical:
131   \group_begin:
132     \siunitx_unit_options_apply:n {#2}
133     \keys_set:nn { siunitx } {#1}
134     \siunitx_unit_format:nN {#2} \l__siunitx_tmp_tl
135     \siunitx_print_unit:V \l__siunitx_tmp_tl
136   \group_end:
137 }

```

(End definition for \ang, \num, and \unit. These functions are documented on page ??.)

```

\qtylist Interfaces for compound values.
\numlist 138 \NewDocumentCommand \qtylist
\qtyproduct 139 { 0 { } > { \SplitList { ; } } m > { \TrimSpaces } m }
\numproduct 140 {
\qtyrange 141 \mode_leave_vertical:
142 \group_begin:
143 \siunitx_unit_options_apply:n {#3}
144 \keys_set:nn { siunitx } {#1}
145 \siunitx_quantity_list:nn {#2} {#3}
146 \group_end:
147 }
148 \NewDocumentCommand \numlist { 0 { } > { \SplitList { ; } } m }
149 {
150 \mode_leave_vertical:
151 \group_begin:
152 \keys_set:nn { siunitx } {#1}
153 \siunitx_number_list:nn {#2}
154 \group_end:
155 }
156 \NewDocumentCommand \qtyproduct
157 { 0 { } > { \SplitList { x } } m > { \TrimSpaces } m }
158 {
159 \mode_leave_vertical:
160 \group_begin:
161 \siunitx_unit_options_apply:n {#3}
162 \keys_set:nn { siunitx } {#1}
163 \siunitx_quantity_product:nn {#2} {#3}
164 \group_end:
165 }
166 \NewDocumentCommand \numproduct
167 { 0 { } > { \SplitList { x } } m > { \TrimSpaces } m }
168 {
169 \mode_leave_vertical:
170 \group_begin:
171 \keys_set:nn { siunitx } {#1}
172 \siunitx_number_product:n {#2}
173 \group_end:
174 }
175 \NewDocumentCommand \qtyrange { 0 { } m m > { \TrimSpaces } m }
176 {
177 \mode_leave_vertical:
178 \group_begin:
179 \siunitx_unit_options_apply:n {#4}
180 \keys_set:nn { siunitx } {#1}
181 \siunitx_quantity_range:nnn {#2} {#3} {#4}
182 \group_end:
183 }
184 \NewDocumentCommand \numrange { 0 { } m m }
185 {
186 \mode_leave_vertical:
187 \group_begin:
188 \keys_set:nn { siunitx } {#1}
189 \siunitx_number_range:nn {#2} {#3}
190 \group_end:

```

```
191 }
```

(End definition for `\qtylist` and others. These functions are documented on page ??.)

`\complexnum` Interfaces for complex numbers.

```
\complexqty 192 \NewDocumentCommand \complexnum { 0 { } m }
193 {
194   \mode_leave_vertical:
195   \group_begin:
196     \keys_set:nn { siunitx } {#1}
197     \siunitx_complex_number:n {#2} \l__siunitx_tmp_tl
198   \group_end:
199 }
200 \NewDocumentCommand \complexqty { 0 { } m m }
201 {
202   \mode_leave_vertical:
203   \group_begin:
204     \siunitx_unit_options_apply:n {#3}
205     \keys_set:nn { siunitx } {#1}
206     \siunitx_complex_quantity:nn {#2} {#3}
207   \group_end:
208 }
```

(End definition for `\complexnum` and `\complexqty`. These functions are documented on page ??.)

`\tablenum` Slightly odd set up at present: we have to have the `\ignorespaces`.

```
209 \NewDocumentCommand \tablenum { 0 { } m }
210 {
211   \mode_leave_vertical:
212   \group_begin:
213     \keys_set:nn { siunitx } {#1}
214     \siunitx_cell_begin:w
215     \ignorespaces #2
216     \siunitx_cell_end:
217   \group_end:
218 }
```

(End definition for `\tablenum`. This function is documented on page ??.)

`\sisetup` A very thin wrapper.

```
219 \NewDocumentCommand \sisetup { m }
220 { \keys_set:nn { siunitx } {#1} }
```

(End definition for `\sisetup`. This function is documented on page ??.)

1.8 “Glue” commands

`__siunitx_angle:nnn` The document level interface for `\ang` needs some “glue” to work with the code-level API.

```
221 \cs_new_protected:Npn \__siunitx_angle:nnn #1#2#3
222 {
223   \tl_if_novalue:nTF {#2}
224     { \siunitx_angle:n {#1} }
225     {
```

```

226         \tl_if_novalue:nTF {#3}
227         { \siunitx_angle:nnn {#1} {#2} { } }
228         { \siunitx_angle:nnn {#1} {#2} {#3} }
229     }
230 }

```

(End definition for `_siunitx_angle:nnn`.)

1.9 Table column

User interfaces in tabular constructs are provided using the mechanisms from the `array` package.

```

231 \RequirePackage { array }

```

`_siunitx_declare_column:Nnn`

Creating numerical columns requires that these are declared before anything else in `\NC@list`: this is necessary to work with optional arguments. This means a bit of manual effort after the simple declaration of a new column type.

```

232 \cs_new_protected:Npn \_siunitx_declare_column:Nnn #1#2#3
233 {
234     \cs_if_exist:cT { NC@find@ #1 }
235     {
236         \cs_undefine:c { NC@find@ #1 }
237         \cs_set_protected:Npn \_siunitx_tmp:w ##1 \NC@do #1 ##2 \q_stop
238         { \NC@list {##1##2} }
239         \exp_after:wN \_siunitx_tmp:w \the \NC@list \q_stop
240         \msg_warning:nnn { siunitx } { column-overwritten } {#1}
241     }
242     \newcolumntype {#1} { }
243     \cs_set_protected:Npn \_siunitx_tmp:w \NC@do ##1##2 \NC@do #1
244     { \NC@list { \NC@do ##1 \NC@do #1 ##2 } }
245     \exp_after:wN \_siunitx_tmp:w \the \NC@list
246     \exp_args:NNc \renewcommand * { NC@rewrite@ #1 } [ 1 ] [ ]
247     {
248         \@temptokena \expandafter
249         {
250             \the \@temptokena
251             > {#2} c < {#3}
252         }
253         \NC@find
254     }
255 }
256 \msg_new:nnn { siunitx } { column-overwritten }
257 { Tabular~column~type~"#1"~overwritten~with~siunitx~definition. }

```

When `mdwtab` is loaded the syntax required is slightly different.

```

258 \AtBeginDocument
259 {
260     \ifpackageloaded { mdwtab }
261     {
262         \cs_set_protected:Npn \_siunitx_declare_column:Nnn #1#2#3
263         {
264             \cs_if_exist:cT { NC@find@ #1 }
265             {
266                 \cs_undefine:c { NC@find@ #1 }

```

```

267         \msg_warning:nnn { siunitx } { column-overwritten } {#1}
268     }
269     \newcolumnntype {#1} [ 1 ] [ ]
270     { > {#2} c < {#3} }
271 }
272 }
273 { }
274 \tl_map_inline:Nn \l__siunitx_column_type_tl
275 {
276     \__siunitx_declare_column:Nnn #1
277     {
278         \keys_set:nn { siunitx } {##1}
279         \siunitx_cell_begin:w
280     }
281     { \siunitx_cell_end: }
282 }
283 }

```

(End definition for __siunitx_declare_column:Nnn.)

1.10 Document commands in bookmarks

In bookmarks, the siunitx document commands need to produce simple strings that represent their input as far as possible.

__siunitx_bookmark_cmd:Nn To keep things fast, expandable versions of the document command are created only once. As here we are at the top-level for internal names, we can use the various parts of siunitx-compound that would otherwise be inaccessible.

```

284 \cs_new_protected:Npn \__siunitx_bookmark_cmd:Nnn #1#2#3
285 {
286     \exp_args:Nc \DeclareExpandableDocumentCommand
287     { \cs_to_str:N #1 \c_space_tl ( pdfstring ~ context ) }
288     {#2} {#3}
289 }
290 \__siunitx_bookmark_cmd:Nnn \qty { o m m } { #2 ~ #3 }
291 \__siunitx_bookmark_cmd:Nnn \ang { m } { \__siunitx_angle:n {#1} }
292 \__siunitx_bookmark_cmd:Nnn \num { o m } { #2 }
293 \__siunitx_bookmark_cmd:Nnn \unit { o m } { #2 }
294 \__siunitx_bookmark_cmd:Nnn \numlist { o m }
295 {
296     \__siunitx_list_use:nnVVV {#2} { }
297     \l_siunitx_list_separator_pair_tl
298     \l_siunitx_list_separator_tl
299     \l_siunitx_list_separator_final_tl
300 }
301 \__siunitx_bookmark_cmd:Nnn \qtylist { o m m }
302 {
303     \__siunitx_list_use:nnVVV {#2} {#3}
304     \l_siunitx_list_separator_pair_tl
305     \l_siunitx_list_separator_tl
306     \l_siunitx_list_separator_final_tl
307 }
308 \__siunitx_bookmark_cmd:Nnn \numproduct { o m } { }
309 \__siunitx_bookmark_cmd:Nnn \qtyproduct { o m m } { }

```

```

310 \__siunitx_bookmark_cmd:Nnn \numrange { o m m }
311 { #2 \tl_use:N \l_siunitx_range_phrase_tl #3 }
312 \__siunitx_bookmark_cmd:Nnn \qtyrange { o m m m }
313 { #2 ~ #4 \tl_use:N \l_siunitx_range_phrase_tl #3 ~ #4 }

(End definition for \__siunitx_bookmark_cmd:Nn.)

We also need the v2 names.

314 \__siunitx_bookmark_cmd:Nnn \si { o m } { #2 }
315 \__siunitx_bookmark_cmd:Nnn \SI { o m 0 { } m } { #3 #2 ~ #4 }
316 \__siunitx_bookmark_cmd:Nnn \SIlist { o m m }
317 {
318   \__siunitx_list_use:nnVVV {#2} {#3}
319   \l_siunitx_list_separator_pair_tl
320   \l_siunitx_list_separator_tl
321   \l_siunitx_list_separator_final_tl
322 }
323 \__siunitx_bookmark_cmd:Nnn \SIrange { o m m m }
324 { #2 ~ #4 \tl_use:N \l_siunitx_range_phrase_tl #3 ~ #4 }

```

\c__siunitx_bookmark_seq Commands usable in bookmarks

```

325 \seq_const_from_clist:Nn \c__siunitx_bookmark_seq
326 {
327   \ang , \qty , \num , \unit ,
328   \numlist , \qtylist ,
329   \numrange , \qtyrange ,
330   \si , \SI , \SIlist , \SIrange
331 }

(End definition for \c__siunitx_bookmark_seq.)

Activate the document commands here: the unit macros are handled in siunitx-final.

332 \AtBeginDocument
333 {
334   \ifpackageloaded { hyperref }
335   {
336     \pdfstringdefDisableCommands

Part II

siunitx-angle – Formatting angles

1 Formatting angles

`\siunitx_angle:n`
`\siunitx_angle:nnn`

`\siunitx_angle:n {⟨angle⟩}`
`\siunitx_angle:nnn {⟨degrees⟩} {⟨minutes⟩} {⟨seconds⟩}`

Typeset the $\langle angle \rangle$ (which may be given as separate $\langle degree \rangle$, $\langle minute \rangle$ and $\langle second \rangle$ components). The $\langle angle \rangle$ (or components) may be given as expressions. The $\langle angle \rangle$ should be a number as understood by `\siunitx_format_number:nN`, with no uncertainty, exponent or imaginary part. The unit symbols for degrees, minutes and seconds are `\degree`, `\arcminute` and `\arcsecond`, respectively

1.1 Key-value options

The options defined by this submodule are available within the `l3keys siunitx` tree.

`angle-mode`

`angle-mode = ⟨choice⟩`

Selects how angles are formatted: a choice from the options `arc`, `decimal` and `input`. The option `arc` means that angles will always be typeset in arc (degree, minute, second) format, whilst `decimal` means that angles are typeset as a single decimal value. The `input` setting means that the input format (*i.e.* difference between `\siunitx_angle:n` and `\siunitx_angle:nnn`) is maintained. The standard setting is `input`.

`angle-symbol-degree`
`angle-symbol-minute`
`angle-symbol-second`

`angle-symbol-degree = ⟨symbol⟩`

Sets the symbol used for arc degrees, minutes or seconds, respectively.

`angle-symbol-over-decimal`

`angle-symbol-over-decimal = true|false`

Determines if the arc separator is printed over the decimal marker, a format used in astronomy. The standard setting is `false`.

`arc-separator`

`arc-separator = ⟨separator⟩`

Inserted between arc parts (degree, minute and second components). The standard setting is `\,`.

`fill-angle-degrees`

`fill-arc-degrees = true|false`

Determines whether a missing degrees part is zero-filled when printing an arc. The standard setting is `false`.

`fill-angle-minutes`

`fill-arc-minutes = true|false`

Determines whether a missing minutes part is zero-filled when printing an arc. The standard setting is `false`.

| | |
|-------------|---|
| <hr/> <hr/> | <code>fill-arc-seconds = true false</code> |
| | Determines whether a missing seconds part is zero-filled when printing an arc. The standard setting is <code>false</code> . |
| <hr/> <hr/> | <code>number-angle-product = $\langle separator \rangle$</code> |
| | Inserted between the value of an angle and the unit (degree, minute or second component). The standard setting is <code>\,</code> . |

2 siunitx-angle implementation

Start the DocStrip guards.

```
1  $\langle *package \rangle$ 
```

Identify the internal prefix (L^AT_EX3 DocStrip convention): only internal material in this *submodule* should be used directly.

```
2  $\langle @@=siunitx\_angle \rangle$ 
```

Scratch space.

```
\l__siunitx_angle_tmp_bool
\l__siunitx_angle_tmp_dim
\l__siunitx_angle_tmp_tl
```

```
3 \bool_new:N \l__siunitx_angle_tmp_bool
4 \dim_new:N \l__siunitx_angle_tmp_dim
5 \tl_new:N \l__siunitx_angle_tmp_tl
```

(End definition for `\l__siunitx_angle_tmp_bool`, `\l__siunitx_angle_tmp_dim`, and `\l__siunitx_angle_tmp_tl`.)

```
\l__siunitx_angle_symbol_degree_tl

```

The final stage of printing an angle is to put together the three parts: this works even for decimal angles as they will blank arguments for the other two parts. The need to handle astronomy-style formatting means that the number has to be decomposed into parts.

Start the DocStrip guards.

1 $\langle *package \rangle$

1 siunitx-compound implementation

2 $\backslash cs_generate_variant:Nn \backslash keys_set:nn \{ nx \}$

1.1 General mechanism

Identify the internal prefix (L^AT_EX3 DocStrip convention): only internal material in this *submodule* should be used directly.

3 $\langle @@=siunitx_compound \rangle$

Typesetting lists, ranges and products of numbers or quantities has shared features which mean they are best handled using a common mechanism. The aim therefore is to abstract out enough of the process such that output-specific aspects can be left to separate processes.

Scratch space.

4 $\backslash fp_new:N \backslash l_siunitx_compound_tmp_fp$
5 $\backslash seq_new:N \backslash l_siunitx_compound_tmp_seq$
6 $\backslash tl_new:N \backslash l_siunitx_compound_tmp_tl$

(End definition for $\backslash l_siunitx_compound_tmp_fp$, $\backslash l_siunitx_compound_tmp_seq$, and $\backslash l_siunitx_compound_tmp_tl$.)

The first number in the list in internal format.

7 $\backslash tl_new:N \backslash l_siunitx_compound_first_tl$

(End definition for $\backslash l_siunitx_compound_first_tl$.)

For storing the combined exponent, if present.

8 $\backslash tl_new:N \backslash l_siunitx_compound_exp_tl$

(End definition for $\backslash l_siunitx_compound_exp_tl$.)

Data on the end-of-list.

9 $\backslash tl_new:N \backslash l_siunitx_compound_start_tl$
10 $\backslash tl_new:N \backslash l_siunitx_compound_end_tl$

(End definition for $\backslash l_siunitx_compound_start_tl$ and $\backslash l_siunitx_compound_end_tl$.)

Data on the length-of-list.

11 $\backslash int_new:N \backslash l_siunitx_compound_count_int$

(End definition for $\backslash l_siunitx_compound_count_int$.)

Data on the unit.

12 $\backslash bool_new:N \backslash l_siunitx_compound_unit_bool$
13 $\backslash tl_new:N \backslash l_siunitx_compound_unit_tl$

(End definition for \l__siunitx_compound_unit_bool and \l__siunitx_compound_unit_tl.)

Purely internal for the present.

```
\l__siunitx_compound_bracket_close_tl

```

Printing a generic set starts with the question of whether we want to extract exponents. If we do, then there is the work to do with extraction. Either way, the printing is handed off to a common function. We do a quick count up-front to avoid excess work when there is not actually a list.

```

586         \text { to }
587         \ifmmode \ \else \space \fi
588     } ,
589 range-units              = repeat
590 }
591 \end{package}

```

Part IV

siunitx-locale — Localisation

This submodule is concerned with localisation of siunitx output based on the locale. If the `translations` package is available, this is loaded here and used to provide various fixed strings for output.

locale `locale = $\langle locale \rangle$`

Selects the $\langle locale \rangle$ used to apply standard settings for other keys, principally `exponent-product`, `inter-unit-product` and `output-decimal-marker`.

1 siunitx-locale implementation

Start the DocStrip guards.

```
1  $\langle *package \rangle$ 
```

Identify the internal prefix (L^AT_EX3 DocStrip convention): only internal material in this *submodule* should be used directly.

```
2  $\langle @@=siunitx\_locale \rangle$ 
```

1.1 Locales

The basics for defining locales are easy: these are just meta keys.

```
3 \keys_define:nn { siunitx }
4   {
5     locale .choice: ,
6     locale / DE .meta:n =
7       {
8         exponent-product      = \cdot ,
9         inter-unit-product    = \, ,
10        output-decimal-marker = { , }
11      } ,
12    locale / FR .meta:n =
13      {
14        exponent-product      = \times ,
15        inter-unit-product    = \, ,
16        output-decimal-marker = { , }
17      } ,
18    locale / UK .meta:n =
19      {
20        exponent-product      = \times ,
21        inter-unit-product    = \, ,
22        output-decimal-marker = .
23      } ,
24    locale / US .meta:n =
25      {
26        exponent-product      = \times ,
27        inter-unit-product    = \, ,
28        output-decimal-marker = .
29      } ,
```

```

30 locale / ZA .meta:n =
31 {
32     exponent-product      = \times ,
33     inter-unit-product    = \cdot ,
34     output-decimal-marker = { , }
35 }
36 }

```

1.2 Localisation

Localisation makes use of the translator package. This only happens if it is available, and is transparent to the user.

```

37 \file_if_exist:nT { translations.sty }
38 {
39     \RequirePackage { translations }
40     \DeclareTranslation { Catalan } { and } { i }
41     \DeclareTranslation { Catalan } { to~(numerical~range) } { a }
42     \DeclareTranslation { English } { to~(numerical~range) } { to }
43     \DeclareTranslation { French } { to~(numerical~range) } { à }
44     \DeclareTranslation { German } { to~(numerical~range) } { bis }
45     \DeclareTranslation { Spanish } { to~(numerical~range) } { a }
46     \keys_set:nn { siunitx }
47     {
48         list-final-separator =
49         {
50             \ifmmode \ \else \space \fi
51             \text { \GetTranslation { and } }
52             \ifmmode \ \else \space \fi
53         } ,
54         list-pair-separator =
55         {
56             \ifmmode \ \else \space \fi
57             \text { \GetTranslation { and } }
58             \ifmmode \ \else \space \fi
59         } ,
60         range-phrase =
61         {
62             \ifmmode \ \else \space \fi
63             \text { \GetTranslation { to~(numerical~range) } }
64             \ifmmode \ \else \space \fi
65         }
66     }
67 }

```

Part V

siunitx-number – Parsing and formatting numbers

This submodule is dedicated to parsing and formatting numbers. A small number of L^AT_EX 2_ε math mode commands are assumed to be available as part of the formatted output. The sign commands `\mp`, `\pm`, `\ll`, `\le`, `\gg` and `\ge` are used to replace two-character input; `\pm` is also required for the output of uncertainties. The standard settings require `\times`. For the display of colored negative numbers, the command `\color` is assumed to be available. Where the latter may apply, numbers should be printed inside a group: note that T_EX grouping is not added *within* formatted numbers as they may need to be decomposed into parts (see `\siunitx_number_output:NN`). Such a color will be the *first* part of the result, meaning that a test for an initial `\color` and following brace group may be used to detect/remove/adjust this part.

1 Formatting numbers

```
\siunitx_number_parse:nN
\siunitx_number_parse:VN
```

```
\siunitx_number_parse:nN {\<number>} \<tl var>
```

Parses the *number* and stores the resulting internal representation in the *<tl var>*. The parsing is influenced by the various key–value settings for numerical input. The *<number>* should comprise a single real value, possibly with comparator, uncertainty and exponent parts. If the number is invalid, or if number parsing is disabled, the result will be an entirely empty *<tl var>*.

The structure of a valid number is:

$$\{\langle comparator \rangle\} \{\langle sign \rangle\} \{\langle integer \rangle\} \{\langle decimal \rangle\} \{\langle uncertainty \rangle\} \\ \{\langle exponent sign \rangle\} \{\langle exponent \rangle\}$$

where the two sign parts must be single tokens if present, and all other components must be given in braces. The number will have at least one digit for both the *<integer>* and *<exponent>* parts: these are required. The *<uncertainty>* part should either be blank or contain an *<identifier>* (as a brace group), followed by one or more data entries. Valid *<identifiers>* currently are

S A single symmetrical uncertainty (*e.g.* a statistical standard uncertainty)

`\siunitx_number_process:NN`

`\siunitx_number_process:N` $\langle tl\ var1 \rangle$ $\langle tl\ var2 \rangle$

Applies a set of number processing operations to the $\langle internal\ number \rangle$ stored in the $\langle tl\ var1 \rangle$, viz. in order

1. Dropping uncertainty
2. Converting to scientific mode (or similar)
3. Rounding
4. Dropping zero decimal part
5. Forcing a minimum number of digits

with the result stored in $\langle tl\ var2 \rangle$.

| | | | |
|--|---|--|---|
| <code>\siunitx_number_output:N</code> | ☆ | <code>\siunitx_number_output:N</code> | $\langle number \rangle$ |
| <code>\siunitx_number_output:n</code> | ☆ | <code>\siunitx_number_output:NN</code> | $\langle number \rangle$ $\langle marker \rangle$ |
| <code>\siunitx_number_output:NN</code> | ☆ | | |
| <code>\siunitx_number_output:nN</code> | ☆ | | |

Formats the $\langle number \rangle$ (in the siunitx internal format), producing the result in a form suitable for typesetting in math mode. The details for the formatting are controlled by a number of key–value options. Note that *formatting* does not apply any manipulation (processing) to the number. This function is usable in an e- or x-type expansion, and further uncontrolled expansion is prevented by appropriate use of `\exp_not:n` internally.

In the NN version, the $\langle marker \rangle$ token is inserted at each possible alignment position in the output, viz.

- Between the comparator and the integer (*before* any sign for the integer)
- Between the sign and the first digit of the integer
- Both sides of the decimal marker
- Both sides of the separated uncertainty sign (*i.e.* after the decimal part and before any integer uncertainty part)
- Both sides of the decimal marker for a separated uncertainty
- Both sides of the multiplication symbol for the exponent part.

The n and nN version take a token list, which should be in the internal siunitx format.

`\siunitx_number_format:nN`

`\siunitx_number_format:nN` $\{ \langle number \rangle \}$ $\langle tl\ var \rangle$

Carries out a combination of `\siunitx_number_parse:nN`, `\siunitx_number_process:NN` and `\siunitx_number_output:N` using x-type expansion to place the result in the $\langle tl\ var \rangle$. If `\l_siunitx_number_parse_bool` if false, the input is simply stored inside the $\langle tl\ var \rangle$ inside `\ensuremath`.

| | | | |
|---|---|---|---|
| <code>\siunitx_number_adjust_exponent:Nn</code> | ★ | <code>\siunitx_number_adjust_exponent:Nn</code> | $\langle number \rangle$ $\{ \langle fp\ expr \rangle \}$ |
| <code>\siunitx_number_adjust_exponent:nn</code> | ★ | | |

Adjusts the exponent of the $\langle number \rangle$ (in internal format) by the $\langle fp\ expr \rangle$ and leaves the result in the input stream.

| | |
|--|---|
| <code>\siunitx_number_normalize_symbols:N</code> | <code>\siunitx_number_normalize_symbols:N <tl var></code> |
|--|---|

Replaces all multi-token signs and comparators in the $\langle tl\ var \rangle$ with their single-token equivalents. Replaces any active hyphen tokens with non-active versions.

| | |
|---------------------------------------|---|
| <code>\siunitx_if_number_p:n *</code> | <code>\siunitx_if_number_token:NTF {\tokens}</code> |
| <code>\siunitx_if_number:nTF *</code> | <code>{\true code} {\false code}</code> |

Determines if the $\langle tokens \rangle$ form a valid number which can be fully parsed by `siunitx`.

| | |
|---|--|
| <code>\siunitx_if_number_token:NTF</code> | <code>\siunitx_if_number_token:NTF {\token}</code> |
| | <code>{\true code} {\false code}</code> |

Determines if the $\langle token \rangle$ is valid in a number based on those tokens currently set up for detection in a number.

| |
|--|
| <code>\l_siunitx_bracket_ambiguous_bool</code> |
|--|

A switch to control whether ambiguous numbers are bracketed: this can also be covered in quantity formatting by a setting there.

| |
|---|
| <code>\l_siunitx_number_parse_bool</code> |
|---|

A switch to control whether any parsing is attempted for numbers.

| |
|--|
| <code>\l_siunitx_number_comparator_tl</code> |
| <code>\l_siunitx_number_exponent_tl</code> |
| <code>\l_siunitx_number_sign_tl</code> |

The list of possible input comparators, exponent markers and signs.

| |
|--|
| <code>\l_siunitx_number_input_decimal_tl</code> |
| <code>\l_siunitx_number_output_decimal_tl</code> |

The list of possible input decimal marker(s), and the output marker.

1.1 Key-value options

The options defined by this submodule are available within the `l3keys siunitx` tree.

2 siunitx-number implementation

Start the DocStrip guards.

```
1  $\langle *package \rangle$ 
```

Identify the internal prefix (L^AT_EX3 DocStrip convention): only internal material in this *submodule* should be used directly.

```
2  $\langle @@=siunitx\_number \rangle$ 
```

2.1 Initial set-up

Variants not provided by expl3.

```
3 \cs_generate_variant:Nn \tl_if_blank:nTF { f }
4 \cs_generate_variant:Nn \tl_if_blank_p:n { f }
5 \cs_generate_variant:Nn \tl_if_in:NnTF { NV }
6 \cs_generate_variant:Nn \tl_remove_all:Nn { NV }
7 \cs_generate_variant:Nn \tl_replace_all:Nnn { NnV }
```

$\backslash l_siunitx_number_tmp_tl$ Scratch space.

```
8 \tl_new:N \l_siunitx_number_tmp_tl
```

(End definition for $\backslash l_siunitx_number_tmp_tl$.)

2.2 Main formatting routine

$\backslash l_siunitx_number_outputted_tl$ A token list for the final formatted result: may or may not be generated by the parser, depending on settings which are active.

```
9 \tl_new:N \l_siunitx_number_outputted_tl
```

(End definition for $\backslash l_siunitx_number_outputted_tl$.)

$\backslash l_siunitx_number_parse_bool$ Tracks whether to parse numbers: public as this may affect other behaviors.

```
10 \tl_new:N \l_siunitx_number_parse_bool
```

(End definition for $\backslash l_siunitx_number_parse_bool$. This variable is documented on page 40.)

$\backslash l_siunitx_number_parse_bool$ Top-level options.

```
11 \keys_define:nn { siunitx }
12 {
13   parse-numbers .bool_set:N = \l_siunitx_number_parse_bool
14 }
```

(End definition for $\backslash l_siunitx_number_parse_bool$. This variable is documented on page 40.)

`\siunitx_number_format:nN`

```

15 \cs_new_protected:Npn \siunitx_number_format:nN #1#2
16 {
17   \group_begin:
18   \bool_if:NTF \l_siunitx_number_parse_bool
19   {
20     \siunitx_number_parse:nN {#1} \l__siunitx_number_parsed_tl
21     \siunitx_number_process:NN \l__siunitx_number_parsed_tl \l__siunitx_number_parsed_tl
22     \tl_set:Nx \l__siunitx_number_outputted_tl
23     { \siunitx_number_output:N \l__siunitx_number_parsed_tl }
24   }
25   { \tl_set:Nn \l__siunitx_number_outputted_tl { \ensuremath {#1} } }
26   \exp_args:NNNV \group_end:
27   \tl_set:Nn #2 \l__siunitx_number_outputted_tl
28 }

```

(End definition for `\siunitx_number_format:nN`. This function is documented on page 39.)

2.3 Parsing numbers

Before numbers can be manipulated or formatted they need to be parsed into an internal form. In particular, if multiple code paths are to be avoided, it is necessary to do such parsing even for relatively simple cases such as converting `1e10` to `1 \times 10^{\{10\}}`.

Storing the result of such parsing can be done in a number of ways. In the first version of `siunitx` a series of separate data stores were used. This is potentially quite fast (as recovery of items relies only on `TeX`’s hash table) but makes managing the various data entries somewhat tedious and error-prone. For version two of the package, a single data structure (property list) was used for each part of the parsed number. Whilst this is easy to manage and extend, it is somewhat slower as at a `TeX` level there are repeated pack–unpack steps. In particular, the fact that there are a limited number of items to track for a “number” means that a more efficient approach is desirable (contrast parsing units, which is open-ended and therefore fits well with using a property list).

In this release, the structure of a valid number is:

$$\langle \text{comparator} \rangle \langle \text{sign} \rangle \langle \text{integer} \rangle \langle \text{decimal} \rangle \langle \text{uncertainty} \rangle \langle \text{exponent sign} \rangle \langle \text{exponent} \rangle$$

where all components must be given in braces. *All* of the components must be present in a stored number (*i.e.* at the end of parsing). The number must have at least one digit for both the `\integer` and `\exponent` parts.

A non-empty `\uncertainty` must contain one leading brace group containing an identifier, then zero or more brace groups which contain the uncertainty data. In this release, the known uncertainty types are

- **S**: A symmetrical statistical uncertainty made up of a single value. These are stored as uncertainty in significant digits, with no radix point in the stored value.

`\l_siunitx_number_input_decimal_tl` The input decimal markers(s).

```

29 \tl_new:N \l_siunitx_number_input_decimal_tl

```

(End definition for `\l_siunitx_number_input_decimal_tl`. This variable is documented on page 40.)

```

\l_siunitx_number_expression_bool
\l_siunitx_number_input_uncert_close_tl
\l_siunitx_number_input_comparator_tl
\l_siunitx_number_input_digit_tl
\l_siunitx_number_input_exponent_tl
\l_siunitx_number_input_ignore_tl
\l_siunitx_number_input_uncert_open_tl
\l_siunitx_number_input_sign_tl
\l_siunitx_number_input_uncert_sign_tl
\l_siunitx_number_explicit_plus_bool
\l_siunitx_number_zero_uncert_bool
\l_siunitx_number_expression:n

```

Options which determine the various valid parts of a parsed number.

```

(End definition for \l_siunitx_number_expression_bool and others. These variables are documented on page ??.)

```
\l_siunitx_number_arg_tl
```

The input argument or a part thereof, depending on the position in the parsing routine.

```
70 \tl_new:N \l_siunitx_number_arg_tl
```

(End definition for \l_siunitx_number_arg_tl.)

```
\l_siunitx_number_comparator_tl
```

A comparator, if found, is held here.

```
71 \tl_new:N \l_siunitx_number_comparator_tl
```

(End definition for \l_siunitx_number_comparator_tl.)

`\l_siunitx_number_exponent_tl` The exponent part of a parsed number. It is easiest to find this relatively early in the parsing process, but as it needs to go at the end of the internal format is held separately until required.

72 `\tl_new:N \l_siunitx_number_exponent_tl`

(End definition for `\l_siunitx_number_exponent_tl`.)

`\l_siunitx_number_flex_tl` In a number with an uncertainty, the exact meaning of a second part is not fully resolved until parsing is complete. That is handled using this “flexible” store.

73 `\tl_new:N \l_siunitx_number_flex_tl`

(End definition for `\l_siunitx_number_flex_tl`.)

`\l_siunitx_number_parsed_tl` The number parsed into internal format.

74 `\tl_new:N \l_siunitx_number_parsed_tl`

(End definition for `\l_siunitx_number_parsed_tl`.)

`\l_siunitx_number_input_tl` The numerical input exactly as given by the user.

75 `\tl_new:N \l_siunitx_number_input_tl`

(End definition for `\l_siunitx_number_input_tl`.)

`\l_siunitx_number_partial_tl` To avoid needing to worry about the fact that the final data stores are somewhat tricky to add to token-by-token, a simple store is used to build up the parsed part of a number before transferring in one go.

76 `\tl_new:N \l_siunitx_number_partial_tl`

(End definition for `\l_siunitx_number_partial_tl`.)

`\l_siunitx_number_validate_bool` Used to set up for validation with no error production.

77 `\bool_new:N \l_siunitx_number_validate_bool`

(End definition for `\l_siunitx_number_validate_bool`.)

`\siunitx_number_normalize_symbols:N` There are two parts to the replacement code. First, any active hyphens signs are normalised: these can come up with some packages and cause issues. Multi-token signs then are converted to the single token equivalents so that everything else can work on a one token basis.

`_siunitx_number_normalize_aux:nN`
`_siunitx_number_normalize_sign:N`
`\c_siunitx_number_normalize_tl`

```
78 \cs_new_protected:Npn \siunitx_number_normalize_symbols:N #1

107   }
108 \group_end:

```

(End definition for `\siunitx_number_normalize_symbols:N` and others. This function is documented on page 40.)

`\siunitx_number_parse:nN` After some initial set up, the parser expands the input and then replaces as far as possible tricky tokens with ones that can be handled using delimited arguments. To avoid multiple conditionals here, the parser is set up as a chain of commands initially, with a loop only later. This avoids more conditionals than are necessary.

```

_siunitx_number_parse_combine_uncert: Conversion of a second numerical part to an uncertainty needs a bit of work. The first step is to extract the useful information from the two stores: the sign, integer and decimal parts from the real number and the integer and decimal parts from the second number. That is done using the input stack to avoid lots of assignments.

```

170 \cs_new_protected:Npn \__siunitx_number_parse_combine_uncert:
171 {
172   \exp_after:wN \exp_after:wN \exp_after:wN
173   \__siunitx_number_parse_combine_uncert_auxi:nnnnnnnn
174   \exp_after:wN \l__siunitx_number_parsed_tl \l__siunitx_number_flex_tl
175 }

```

Here, #4, #5 and #8 are all junk arguments simply there to mop up tokens, while #1 will be recovered later from \l__siunitx_number_parsed_tl so does not need to be passed about. The difference in places between the two decimal parts is now found: this is done just once to avoid having to parse token lists twice. The value is then used to generate

a number of filler 0 tokens, and these are added to the appropriate part of the number. Finally, everything is recombined: the integer part only needs a test to avoid an empty main number.

__siunitx_number_parse_exponent:

An exponent part of a number has to come at the end and can only occur once. Thus it is relatively easy to parse. First, there is a check that an exponent part is allowed, and if so a split is made (the previous part of the chain checks that there is some content in \l__siunitx_number_arg_tl before calling this function). After splitting, if there is no exponent then simply save a default. Otherwise, check for a sign and then store either this or an implicit plus, and the digits after a check that nothing else is present after the e. The only slight complication to all of this is allowing an arbitrary token in the input to represent the exponent: this is done by setting any exponent tokens to the first of the allowed list, then using that in a delimited argument set up. Once an exponent part is found, there is a loop to check that each of the tokens is a digit then a tidy up step to remove any leading zeros.

```

At this stage, the partial input \l__siunitx_number_arg_tl will contain any mantissa, which may contain an uncertainty or complex part. Parsing this and allowing for all of the different formats possible is best done using a token-by-token approach. However, as at each stage only a subset of tokens are valid, the approach take is to use a set of semi-dedicated functions to parse different components along with switches to allow a sensible amount of code sharing.

```

365 \cs_new_protected:Npn \__siunitx_number_parse_loop:
366 {
367   \tl_clear:N \l__siunitx_number_partial_tl
368   \exp_after:wN \__siunitx_number_parse_loop_first:NNN
369   \exp_after:wN \l__siunitx_number_parsed_tl \exp_after:wN \c_true_bool
370   \l__siunitx_number_arg_tl
371   \q_recursion_tail \q_recursion_stop
372 }

```

The very first token of the input is handled with a dedicated function. Valid cases here are

- Entirely blank if the original input was for example +e10: simply clean up if in the integer part of issue an error if in a second part (complex number, *etc.*).
- An integer part digit: pass through to the main collection routine.
- A decimal marker: store an empty integer part and move to the main collection routine for a decimal part.

Anything else is invalid and sends the code to the abort function.

```

373 \cs_new_protected:Npn \__siunitx_number_parse_loop_first:NNN #1#2#3

391     }
392     { \__siunitx_number_parse_loop_break:wN }

```

```

393     }
394 }

```

A single function is used to cover the “main” part of numbers: finding real, complex or separated uncertainty parts and covering both the integer and decimal components. This works because these elements share a lot of concepts: a small number of switches can be used to differentiate between them. To keep the code at least somewhat readable, this main function deals with the validity testing but hands off other tasks to dedicated auxiliaries for each case.

The possibilities are

- The number terminates, meaning that some digits were collected and everything is simply tidied up (as far as the loop is concerned).
- A digit is found: this is the common case and leads to a storage auxiliary (which handles non-significant zeros).
- A decimal marker is found: only valid in the integer part and there leading to a store-and-switch situation.
- An open-uncertainty token: switch to the dedicated collector for uncertainties.
- A sign token (if allowed): stop collecting this number and restart collection for the second part.

```

395 \cs_new_protected:Npn \__siunitx_number_parse_loop_main:NNNNN #1#2#3#4#5
396 {

415           {
416             \__siunitx_number_parse_loop_main_sign:NNN
417             #1#2 #5
418           }
419           { \__siunitx_number_parse_loop_break:wN }
420         }
421         { \__siunitx_number_parse_loop_break:wN }
422       }
423     }
424   }
425 }

```

If the main loop finds the end marker then there is a tidy up phase. The current partial number is stored either as the integer or decimal, depending on the setting for the indicator switch. For the integer part, if no number has been collected then one or more non-significant zeros have been dropped. Exactly one zero is therefore needed to make sure the parsed result is correct.

```

426 \cs_new_protected:Npn \__siunitx_number_parse_loop_main_end:NN #1#2
427 {
428   \bool_lazy_and:nnT
429     {#2} { \tl_if_empty_p:N \l__siunitx_number_partial_tl }
430     { \tl_set:Nn \l__siunitx_number_partial_tl { 0 } }
431   \tl_put_right:Nx #1
432     {
433       { \exp_not:V \l__siunitx_number_partial_tl }
434       \bool_if:NT #2 { { } }
435     { }
436   }
437 }

```

The most common case for the main loop collector is to find a digit. Here, in the integer part it is possible that zeros are non-significant: that is handled using a combination of a switch and a string test. Other than that, the situation here is simple: store the input and loop.

```

438 \cs_new_protected:Npn \__siunitx_number_parse_loop_main_digit:NNNN #1#2#3#4#5
439 {
440   \bool_lazy_or:nnTF
441     {#3} { ! \str_if_eq_p:nn {#5} { 0 } }
442     {
443       \tl_put_right:Nn \l__siunitx_number_partial_tl {#5}
444       \__siunitx_number_parse_loop_main:NNNN #1 #2 \c_true_bool #4
445     }
446     { \__siunitx_number_parse_loop_main:NNNN #1 #2 \c_false_bool #4 }
447 }

```

When a decimal marker was found, move the integer part to the store and then go back to the loop with the flags set correctly. There is the case of non-significant zeros to cover before that, of course.

```

448 \cs_new_protected:Npn \__siunitx_number_parse_loop_main_decimal:NN #1#2
449 {
450   \__siunitx_number_parse_loop_main_store:NNN #1 \c_false_bool \c_false_bool
451   \__siunitx_number_parse_loop_after_decimal:NNN #1 #2
452 }

```

Starting an uncertainty part means storing the number to date as in other cases, with the possibility of a blank decimal part allowed for. The uncertainty itself is collected by a dedicated function as it is extremely restricted.

```

453 \cs_new_protected:Npn \__siunitx_number_parse_loop_main_uncert:NNN #1#2#3
454 {
455   \__siunitx_number_parse_loop_main_store:NNN #1 #2 \c_false_bool
456   \__siunitx_number_parse_uncert:NN #1
457 }

```

If a sign is found, terminate the current number, store the sign as the first token of the second part and go back to do the dedicated first-token function.

```

458 \cs_new_protected:Npn \__siunitx_number_parse_loop_main_sign:NNN #1#2#3

```

```

459 {
460   \__siunitx_number_parse_loop_main_store:NNN #1 #2 \c_true_bool
461   \tl_set:Nn \l__siunitx_number_flex_tl { {#3} }
462   \__siunitx_number_parse_loop_first:NNN
463   \l__siunitx_number_flex_tl \c_false_bool
464 }

```

A common auxiliary for the various non-digit token functions: tidy up the integer and decimal parts of a number. Here, the two flags are used to indicate if empty decimal and uncertainty parts should be included in the storage cycle.

```

465 \cs_new_protected:Npn \__siunitx_number_parse_loop_main_store:NNN #1#2#3
466 {
467   \tl_if_empty:NT \l__siunitx_number_partial_tl

```

Handling a decimal marker in the uncertainty is a bit tricky: we need to make sure it's valid. First, we need to be sure that the integer part of the captured uncertainty is not too long. Then we need to check that the decimal part is not too long, and extend the decimal if it is. Both of these require data from the collected partial number, so we extract that first. Checking the decimal part needs the length of the not-yet-collected uncertainty. Handily, we know that it should be a set of digits then a closing marker. So we can use that as a length: if it's too long we can stop.

883 }

```

This could (and eventually will) be combined with the main function above: that will need e-type expansion. The input has already been normalised such that the integer part is in the range $1 \leq n < 10$. Thus there are only three cases to deal with, depending on the required adjustment to the exponent.

Actually doing the rounding needs us to work from the least significant digit, so we start by reversing the input. We *could* also drop digits in this phase, but tracking everything would be horrible, so we go slightly slower but clearer and split the steps. First we reverse the decimal part, then the integer.

```

1031 \cs_new:Npn \__siunitx_number_round:nnn #1#2#3
1032 {

1061 }

```

We now have the input reversed plus how many digits we need to discard (#1). We have two functions, one which deals with the decimal part, one of which deals with the integer. In the latter, we should never hit the end before we've dropped all the digits: the fixed-zero is a fall-back in case something weird happens. For the integer case, we need to collect up zeros to pad the length back out correctly later.

```

The main rounding routines. These are only ever called when there is rounding to do, so there is no need to carry a flag forward. Thus the question to ask is simple: is the next value a 9 or not (as that continues the sequence). There is a general need to handle the case where a zero is rounded up: that automatically means a need to trim the other end.

Here we deal with the case where rounding applies along with an exponent set based on number of places. We can only get here if an additional integer digit has been added, so there is no need to test for that. There are two cases for action: when using `scientific` mode, where we always need to shift by one, and when using `engineering` mode if we now have four digits. The latter is a bit more work: we need to trim digits off as required.

Formatting signs has to deal with some additional formatting requirements for negative numbers. Making such numbers by bracketing them needs some rearrangement of the order of tokens, which is set up in the main formatting macro by the dedicated do-nothing end function. We also have the comparator passed here: if it is present, we need to deal with tighter spacing.

```

Uncertainties which are directly attached are easy to deal with. For those that are separated, the first step is to find if they are entirely contained within the decimal part, and to pad if they are. For the case where the boundary is crossed to the integer part, the correct number of digit tokens need to be removed from the start of the uncertainty and the split result sent to the appropriate auxiliaries.

```

Setting the exponent part requires some information about the mantissa: was it there or not. This means that whilst only the sign and value for the exponent are typeset here, there is a need to also have access to the combined mantissa part (with a decimal

marker). The rest of the work is about picking up the various options and getting the combinations right. For signs, the auxiliary from the main sign routine can be used, but not the main function: negative exponents don't have special handling.

Part VI

siunitx-print – Printing material with font control

1 Printing quantities

This submodule is focussed on providing controlled printing for numbers and units. Key to this is control of font: conventions for printing quantities mean that the exact nature of the output is important. At the same time, this module provides flexibility for the user in terms of which aspects of the font are responsive to the surrounding general text. Printing material may also take place in text or math mode.

The printing routines assume that normal L^AT_EX 2_ε font selection commands are available, in particular `\bfseries`, `\mathrm`, `\mathversion`, `\fontfamily`, `\fontseries` and `\fontshape`, `\familydefault`, `\seriesdefault`, `\shapedefault` and `\selectfont`. It also requires the standard L^AT_EX 2_ε kernel commands `\ensuremath`, `\mbox`, `\textsubscript` and `\textsuperscript` for printing in text mode. The following packages are also required to provide the functionality detailed.

- `color`: support for color using `\textcolor`
- `textcomp`: `\textminus`, `\textpm`, `\texttimes` and `\textcenteredperiod` for printing in text mode
- `amstext`: the `\text` command for printing in text mode

For detection of math mode fonts, as well as `\mathrm`, the existence of `\symoperators` is assumed; other math font commands are not *required* to exist.

```
\siunitx_print_number:n  
\siunitx_print_number:(V|x)  
\siunitx_print_unit:n  
\siunitx_print_unit:(V|x)
```

```
\siunitx_print_number:n {<material>}  
\siunitx_print_unit:n {<material>}
```

Prints the *<material>* according to the prevailing settings for the submodule as applicable to the *<type>* of content (**number** or **unit**). The *<material>* should comprise normal L^AT_EX mark-up for numbers or units. In particular, units will typically use `\mathrm` to indicate material to be printed in the current upright roman font, and `^` and `_` will typically be used to indicate super- and subscripts, respectively. These elements will be correctly handled when printing for example using `\mathsf` in math mode, or using only text fonts.

```
\siunitx_print_match:n  
\siunitx_print_math:n  
\siunitx_print_text:n
```

```
\siunitx_print_match:n {<material>}  
\siunitx_print_math:n {<material>}  
\siunitx_print_text:n {<material>}
```

Prints the *<material>* as described for `\siunitx_print_...:n` but with a fixed text or math mode output. The printing does *not* set color (which is managed on a **unit/number** basis), but otherwise sets the font as described above. The `match` function uses either the prevailing math or text mode.

1.1 Key-value options

The options defined by this submodule are available within the l3keys `siunitx` tree.

| | |
|----------------------------|---|
| <u>color</u> | <code>color = $\langle color \rangle$</code> |
| | Color to apply to printed output: the latter should be a named color defined for use with <code>\textcolor</code> . The standard setting is empty (no color). |
| <u>mode</u> | <code>mode = match math text</code> |
| | Selects which mode (math or text) the output is printed in: a choice from the options <code>match</code> , <code>math</code> or <code>text</code> . The option <code>match</code> matches the mode prevailing at the point <code>\siunitx_print_...:n</code> is called. The <code>math</code> and <code>text</code> options choose the relevant T _E X mode for printing. The standard setting is <code>math</code> . |
| <u>number-color</u> | <code>number-color = $\langle color \rangle$</code> |
| | Color to apply to numbers in output: the latter should be a named color defined for use with <code>\textcolor</code> . The standard setting is empty (no color). |
| <u>number-mode</u> | <code>number-mode = match math text</code> |
| | Selects which mode (math or text) the numbers are printed in: a choice from the options <code>match</code> , <code>math</code> or <code>text</code> . The option <code>match</code> matches the mode prevailing at the point <code>\siunitx_prin_number:n</code> is called. The <code>math</code> and <code>text</code> options choose the relevant T _E X mode for printing. The standard setting is <code>math</code> . |
| <u>propagate-math-font</u> | <code>propagate-math-font = true false</code> |
| | Switch to determine if the currently-active math font is applied within printed output. This is relevant only when <code>\siunitx_print_...:n</code> is called from within math mode: in text mode there is not active math font. When not active, math mode material will be typeset using standard math mode fonts without any changes being made to the supplied argument. The standard setting is <code>false</code> . |
| <u>reset-math-version</u> | <code>reset-math-version = true false</code> |
| | Switch to determine whether the active <code>\mathversion</code> is reset to <code>normal</code> when printing in math mode. Note that math version is typically used to select <code>\boldmath</code> , though it is also be used by <i>e.g.</i> <code>sansmath</code> . The standard setting is <code>true</code> . |
| <u>reset-text-family</u> | <code>reset-text-family = true false</code> |
| | Switch to determine whether the active text family is reset to <code>\rmfamily</code> when printing in text mode. The standard setting is <code>true</code> . |
| <u>reset-text-series</u> | <code>reset-text-series = true false</code> |
| | Switch to determine whether the active text series is reset to <code>\mdseries</code> when printing in text mode. The standard setting is <code>true</code> . |
| <u>reset-text-shape</u> | <code>reset-text-shape = true false</code> |
| | Switch to determine whether the active text shape is reset to <code>\upshape</code> when printing in text mode. The standard setting is <code>true</code> . |

| | |
|------------------------------------|--|
| <hr/> <hr/> text-family-to-math | <p>text-family-to-math = true false</p> <p>Switch to determine if the family of the current text font should be applied (where possible) to printing in math mode. The standard setting is false.</p> |
| <hr/> <hr/> text-font-command | <p>text-font-command = $\langle cmd \rangle$</p> <p>Command applied to text during output, inserted after any reset of font set-up. This can therefore be used to apply non-standard font set up when printing in text mode. The standard setting is empty.</p> |
| <hr/> <hr/> text-series-to-math | <p>text-series-to-math = true false</p> <p>Switch to determine if the weight of the current text font should be applied (where possible) to printing in math mode. This is achieved by setting the <code>\mathversion</code>, and so will override <code>reset-math-version</code>. The mappings between text and math weight are set . The standard setting is false.</p> |
| <hr/> <hr/> unit-color | <p>unit-color = $\langle color \rangle$</p> <p>Color to apply to units in output: the latter should be a named color defined for use with <code>\textcolor</code>. The standard setting is empty (no color).</p> |
| <hr/> <hr/> unit-mode | <p>unit-mode = match math text</p> <p>Selects which mode (math or text) units are printed in: a choice from the options <code>match</code>, <code>math</code> or <code>text</code>. The option <code>match</code> matches the mode prevailing at the point <code>\siunitx-print...:n</code> is called. The <code>math</code> and <code>text</code> options choose the relevant $\mathrm{T\!E\!X}$ mode for printing. The standard setting is <code>math</code>.</p> |
| <hr/> <hr/> series-version-mapping | <p>series-version-mapping / $\langle weight \rangle$ = $\langle version \rangle$</p> <p>Defines how <code>siunitx</code> maps from text font weight to math font version. The pre-defined weights are those used as-standard by <code>autoinst</code>:</p> <ul style="list-style-type: none"> • ul • el • l • sl • m • sb • b • eb • ub <p>As standard, the <code>m</code> weight maps to normal math version whilst all of the <code>b</code> weights map to bold and all of the <code>l</code> weights map to light.</p> |

2 siunitx-print implementation

Start the DocStrip guards.

```
1 <*package>
```

Identify the internal prefix (L^AT_EX3 DocStrip convention): only internal material in this *submodule* should be used directly.

```
2 <@@=siunitx_print>
```

2.1 Initial set up

The printing routines depend on amstext for text mode working.

```
3 \RequirePackage { amstext }
```

Color support is always required.

```
4 \RequirePackage { color }
```

```
\tl_replace_all:NVn
```

Required variants.

```
5 \cs_generate_variant:Nn \tl_replace_all:Nnn { NV }
```

(End definition for `\tl_replace_all:NVn`. This function is documented on page ??.)

```
\l__siunitx_print_tmp_tl
```

Scratch space.

```
6 \tl_new:N \l__siunitx_print_tmp_tl
```

(End definition for `\l__siunitx_print_tmp_tl`.)

2.2 Printing routines

Options which apply to the main formatting routine, and so are not tied to either symbolic or literal input.

```
\l__siunitx_print_number_color_tl
\l__siunitx_print_number_mode_tl
\l__siunitx_print_unit_color_tl
\l__siunitx_print_unit_mode_tl
\l__siunitx_print_math_font_bool

```

(End definition for `\l__siunitx_print_version_ul_tl` and others.)

`\siunitx_print_number:n`

The main printing function doesn’t actually need to do very much: just set the color and select the correct sub-function.

`\siunitx_print_number:V`

`\siunitx_print_number:x`

`\siunitx_print_unit:n`

`\siunitx_print_unit:V`

`\siunitx_print_unit:x`

`__siunitx_print_aux:nn`

```

60 \cs_new_protected:Npn \siunitx_print_number:n #1
61 { \__siunitx_print_aux:nn { number } {#1} }
62 \cs_generate_variant:Nn \siunitx_print_number:n { V , x }
63 \cs_new_protected:Npn \siunitx_print_unit:n #1
64 { \__siunitx_print_aux:nn { unit } {#1} }
65 \cs_generate_variant:Nn \siunitx_print_unit:n { V , x }
66 \cs_new_protected:Npn \__siunitx_print_aux:nn #1#2
67 {
68     \tl_if_empty:cTF { l__siunitx_print_ #1 _color_tl }
69     { \use:n }
70     { \exp_args:Nv \textcolor { l__siunitx_print_ #1 _color_tl } }
71     {
72         \use:c
73         {
74             siunitx_print_

```

```

75         \tl_use:c { l__siunitx_print_ #1 _mode_tl } :n
76     }
77     {#2}
78 }
79 }

```

(End definition for `\siunitx_print_number:n`, `\siunitx_print_unit:n`, and `__siunitx_print_aux:nn`. These functions are documented on page 91.)

`\siunitx_print_match:n` When the *output* mode should match the input, a simple selection of route can be made.

```

80 \cs_new_protected:Npn \siunitx_print_match:n #1
81 {
82     \mode_if_math:TF
83     { \siunitx_print_math:n {#1} }
84     { \siunitx_print_text:n {#1} }
85 }

```

(End definition for `\siunitx_print_match:n`. This function is documented on page 91.)

`__siunitx_print_replace_font:N` A simple auxiliary for “zapping” the unit font.

```

86 \cs_new_protected:Npn \__siunitx_print_replace_font:N #1
87 {
88     \tl_if_empty:NF \l_siunitx_unit_font_tl
89     {
90         \tl_replace_all:NVn #1
91         \l_siunitx_unit_font_tl
92         { \use:n }
93     }
94 }

```

(End definition for `__siunitx_print_replace_font:N`.)

`\c_siunitx_print_weight_uc_tl` Font widths where the *m* for weight is omitted.

```

95 \clist_map_inline:nn { uc , ec , c , sc , sx , x , ex , ux }
96 { \tl_const:cn { c__siunitx_print_weight_ #1 _tl } { m } }

```

(End definition for `\c_siunitx_print_weight_uc_tl` and others.)

`\c_siunitx_print_weight_l_tl` Font widths with one letter.

```

97 \clist_map_inline:nn { l , m , b }
98 { \tl_const:cn { c__siunitx_print_weight_ #1 _tl } { #1 } }

```

(End definition for `\c_siunitx_print_weight_l_tl`, `\c_siunitx_print_weight_m_tl`, and `\c_siunitx_print_weight_b_tl`.)

`\siunitx_print_math:n`

The first step in setting in math mode is to check on the math version. The starting point is the question of whether text series needs to propagate to math mode: if so, check on the mapping, otherwise check on the current math version.

```

99 \cs_new_protected:Npn \siunitx_print_math:n #1
100 {
101     \bool_if:NTF \l__siunitx_print_math_weight_bool
102     {
103         \tl_set:Nx \l__siunitx_print_tmp_tl
104         { \exp_after:wN \__siunitx_print_extract_series:Nw \f@series ? \q_stop }
105         \tl_if_empty:NTF \l__siunitx_print_tmp_tl
\__siunitx_print_math_auxi:n
\__siunitx_print_math_auxii:n
\__siunitx_print_math_auxiii:n
\__siunitx_print_math_auxiv:n
\__siunitx_print_math_auxv:n
\__siunitx_print_math_aux:N
\__siunitx_print_math_aux:w
\__siunitx_print_math_aux:Nn
\__siunitx_print_math_aux:cn
\__siunitx_print_math_sub:n
\__siunitx_print_math_super:n
\__siunitx_print_math_script:n
\__siunitx_print_math_text:n

```

```

106         { \__siunitx_print_math_auxi:n {#1} }
107         { \__siunitx_print_math_version:Vn \l__siunitx_print_tmp_tl {#1} }
108     }
109     { \__siunitx_print_math_auxi:n {#1} }
110 }

```

Look up the math version from the text series. The weight is omitted if it is `m` plus there are either one or two letters, so we have a little work to do. To keep things fast, we use a hash table based lookup rather than a sequence or property list.

```

111 \cs_new:Npn \__siunitx_print_extract_series:Nw #1#2 ? #3 \q_stop
112 {
113     \cs_if_exist:cTF { c__siunitx_print_weight_ #1#2 _tl }
114     { \__siunitx_print_convert_series:v { c__siunitx_print_weight_ #1#2 _tl } }
115     {
116         \cs_if_exist:cTF { c__siunitx_print_weight_ #1 _tl }
117         { \__siunitx_print_convert_series:v { c__siunitx_print_weight_ #1 _tl } }
118         { \__siunitx_print_convert_series:n {#1#2} }
119     }
120 }
121 \cs_new:Npn \__siunitx_print_convert_series:n #1
122 { \tl_use:c { l__siunitx_print_version_ #1 _tl } }
123 \cs_generate_variant:Nn \__siunitx_print_convert_series:n { v }
124 \cs_new_protected:Npn \__siunitx_print_math_auxi:n #1
125 {
126     \bool_if:NTF \l__siunitx_print_math_version_bool
127     { \__siunitx_print_math_version:nn { normal } {#1} }
128     { \__siunitx_print_math_auxii:n {#1} }
129 }

```

Any setting which changes the math version can only be set from text mode (as it applies at the level of a formula). As such, the first test is to see if that needs to be to check if the math version has to be set: if so, switch to text mode, sort it out and switch back. That of course means that in such cases, line breaking will not be possible.

```

130 \cs_new_protected:Npn \__siunitx_print_math_version:nn #1#2
131 {
132     \str_if_eq:VnTF \math@version { #1 }
133     { \__siunitx_print_math_auxii:n {#2} }
134     {
135         \mode_if_math:TF
136         { \text }
137         { \use:n }
138         {
139             \mathversion {#1}
140             \__siunitx_print_math_auxii:n {#2}
141         }
142     }
143 }
144 \cs_generate_variant:Nn \__siunitx_print_math_version:nn { V }

```

At this point, force math mode then start dealing with setting math font based on text family. If the text family is roman, life is slightly different to if it is sanserif or monospaced. In all cases, the outcomes can be handled using the same routines as for normal math mode treatment. The test here is on a string basis as `\f@family` and the `\...default` commands have different `\long` status.

```

145 \cs_new_protected:Npn \__siunitx_print_math_auxii:n #1
146 { \ensuremath { \__siunitx_print_math_auxiii:n {#1} } }
147 \cs_new_protected:Npn \__siunitx_print_math_auxiii:n #1
148 {
149   \bool_if:NTF \l__siunitx_print_math_family_bool
150   {
151     \str_case_e:nnF { \f@family }
152     {
153       { \rmdefault } { \__siunitx_print_math_auxv:n }
154       { \sfdefault } { \__siunitx_print_math_aux:Nn \mathsf }
155       { \ttdefault } { \__siunitx_print_math_aux:Nn \mathtt }
156     }
157     { \__siunitx_print_math_auxiv:n }
158   }
159   { \__siunitx_print_math_auxiv:n }
160   {#1}
161 }

```

Now we deal with the font selection in math mode. There are two possible cases. First, we are retaining the current math font, and the active one is `\mathsf` or `\mathtt`: that needs to be applied to the argument. Alternatively, if the current font is not retained, ensure that normal math mode rules are active.

```

162 \cs_new_protected:Npn \__siunitx_print_math_auxiv:n #1
163 {
164   \bool_if:NTF \l__siunitx_print_math_font_bool
165   { \__siunitx_print_math_aux:N \mathsf \mathtt \q_recursion_tail \q_recursion_stop }
166   { \__siunitx_print_math_auxv:n }
167   {#1}
168 }
169 \cs_new_protected:Npn \__siunitx_print_math_auxv:n #1
170 {
171   \bool_lazy_or:nnTF
172   { \int_compare_p:nNn \fam = { -1 } }

```

(End definition for `\siunitx_print_text:n` and others. This function is documented on page [91](#).)

2.3 Standard settings for module options

Some of these follow naturally from the point of definition (e.g. boolean variables are always `false` to begin with), but for clarity everything is set here.

```

401 \keys_set:nn { siunitx }
402 {
403   color = ,
404   mode = math ,
405   number-color = ,
406   number-mode = math ,
407   propagate-math-font = false ,
408   reset-math-version = true ,
409   reset-text-shape = true ,
410   reset-text-series = true ,
411   reset-text-family = true ,
412   text-family-to-math = false ,
413   text-font-command = ,
414   text-series-to-math = false ,
415   unit-color = ,
416   unit-mode = math
417 }

```

These are separate as they all fall inside the same key.

```

418 \keys_set:nn { siunitx / series-version-mapping }
419 {
420   ul = light ,
421   el = light ,
422   l = light ,
423   sl = light ,
424   m = normal ,
425   sb = bold ,

```

```
426     b = bold ,  
427     eb = bold ,  
428     ub = bold  
429 }  
430 \package\
```

Part VII

siunitx-quantity — Quantities

This submodule is focussed on providing controlled printing for quantities: the combination of a number and a unit. It largely builds on the submodules `siunitx-number` and `siunitx-unit`. A small number of adjustments are made to standard set up in the latter to reflect additional functionality added here.

`\siunitx_quantity:nn`

`\siunitx_quantity:nn {<number>} {<unit>}`

Parses the `<number>` and the `<unit>` as detailed for `\siunitx_number_parse:nn` and `\siunitx_unit_format:nn`, then prints the results using `\siunitx_print_unit:n`.

`\siunitx_quantity_print:nn`

`\siunitx_quantity_print:nn {<number>} {<unit>}``\siunitx_quantity_print:(nV|VV|xV)`

A low-level function which prints the quantity directly: there is no processing applied to either the `<number>` or `<unit>`. The two parts are printed using `\siunitx_print_unit:n` and appropriate spacing and break-prevention is applied.

`allow-quantity-breaks`

`allow-quantity-breaks = true|false`

Specifies whether breaks are permitted between units. The standard setting is `false`.

`prefix-mode`

`prefix-mode = combine-exponent|extract-exponent|input`

Selects the method used for producing prefixes: a choice from the options `combine-exponent`, `extract-exponent` and `input`. The option `combine-exponent` combines any exponent from the number with the prefix of the first unit, and prints the updated prefix. The option `extract-exponent` removes all prefixes from the unit, and combines them with the exponent of number. The option `input` prints prefixes and exponent as given in the source. The standard setting is `input`.

`quantity-product`

`quantity-product = <tokens>`

The product marker used between a number and the unit. The standard setting is `\,`.

`separate-uncertainty-units`

`separate-uncertainty-units = bracket|repeat|single`

Specifies how units are applied when a separated uncertainty is present: a choice from `bracket`, `repeat` and `single`. The option `bracket` places brackets around the number, with the unit given after these. The option `repeat` means that the unit is printed only once and no brackets are applied. The standard setting is `bracket`.

1 siunitx-quantity implementation

Start the DocStrip guards.

```
1 <*package>
```

Identify the internal prefix (L^AT_EX3 DocStrip convention): only internal material in this *submodule* should be used directly.

```
2 <@@=siunitx_quantity>
```

1.1 Initial set-up

Scratch space.

```

142 }

```

(End definition for `__siunitx_quantity_extract_exp:nNN` and `__siunitx_quantity_extract_exp:nnnnnnnNN`.)

`\siunitx_quanitty_print:nn` For printing a single part of a quantity. This is needed for compound quantities and so is public: that's also the reason for passing both argument explicitly. The lazy test here is looking for the case where a 1 has been inserted at the start of a format unit *and* we have some other number to print: the 1 is then removed and there is no space inserted.

```

143 \cs_new_protected:Npn \siunitx_quantity_print:nn #1#2
144 {

190     }
191 }

```

(End definition for `__siunitx_quantity_non_latin:n` and `__siunitx_quantity_non_latin:nnnn`.)

\degree The `\degree` unit is re-declared here: this is needed for using it in quantities. This is done here as it avoids a dependency in `siunitx-unit` on options it does not contain.

```

192 \siunitx_declare_unit:Nxn \degree
193 { \__siunitx_quantity_non_latin:n { "00B0 } }
194 { quantity-product = { } }

```

(End definition for `\degree`. This function is documented on page [143](#).)

```

195 </package>

```

Part VIII

siunitx-symbol – Symbol-related settings

1 siunitx-symbol implementation

Start the DocStrip guards.

```
1 \<package>
```

Identify the internal prefix (L^AT_EX3 DocStrip convention): only internal material in this *submodule* should be used directly.

```
2 \<@@=siunitx-symbol>
```

```
\l__siunitx_symbol_tmpa_tl
```

Scratch space.

```
\l__siunitx_symbol_tmpb_tl
```

```
3 \tl_new:N \l__siunitx_symbol_tmpa_tl
```

```
4 \tl_new:N \l__siunitx_symbol_tmpb_tl
```

(End definition for `\l__siunitx_symbol_tmpa_tl` and `\l__siunitx_symbol_tmpb_tl`.)

A small number of commands are needed from the companion fonts when working with 8-bit engines. These are loaded by modern L^AT_EX 2_ε kernel, so for older ones, force loading them using `textcomp`.

```
5 \AtBeginDocument
```

```
6 {
```

```
7   \cs_if_free:cT { T@TS1 }
```

```
8   { \RequirePackage { textcomp } }
```

```
9 }
```

```
\_siunitx_symbol_non_latin:n
```

As in `siunitx-unit`, but internal in both cases as it's rather specialised.

```
\_siunitx_symbol_non_latin:nnnn
```

```
10 \bool_lazy_or:nnTF
```

```
11 { \sys_if_engine luatex_p: }

```

```
15   { \char_generate:nn {#1} { \char_value_catcode:n {#1} } }
```

```
16 }
```

```
17 {
```

```
18   \cs_new:Npn \_siunitx_symbol_non_latin:n #1
```

```
19   {
```

```
20     \exp_last_unbraced:Nf \_siunitx_symbol_non_latin:nnnn
```

```
21     { \char_to_utfviii_bytes:n {#1} }
```

```
22   }
```

```
23   \cs_new:Npn \_siunitx_symbol_non_latin:nnnn #1#2#3#4
```

```
24   {
```

```
25     \_siunitx_symbol_deal_with_utf:
```

```
26     \exp_after:wN \exp_after:wN \exp_after:wN
```

```
27     \exp_not:N \char_generate:nn {#1} { 13 }
```

```
28     \char_generate:nn {#2} { 12 }
```

```
29   }
```

```
30 }
```

```
31 \cs_new:Npn \_siunitx_symbol_deal_with_utf: { }
```

(End definition for `_siunitx_symbol_non_latin:n` and `_siunitx_symbol_non_latin:nnnn`.)

`_siunitx_symbol_if_replace:NnT`

A test to see if the unit definition which applies is still one we expect: here that means it is just using a (Unicode) codepoint. The comparison is string-based as `unicode-math` (at least) can alter some of them. Active characters are set to `\scan_stop:` so that the code here gives exactly the tokens (bytes) we want: needed for encodings other than UTF-8.

```

32 \prg_new_protected_conditional:Npnn \_siunitx_symbol_if_replace:Nn #1#2 { T , TF }
33 {
34   \group_begin:
35   \protected@edef \l__siunitx_symbol_tmpa_tl
36     { \exp_not:N \mathrm { \_siunitx_symbol_non_latin:n {#2} } }
37   \int_step_inline:nnn { "80 } { "FF }
38     { \char_set_active_eq:nN {##1} \scan_stop: }
39   \keys_set:nn { siunitx } { parse-units = false }
40   \siunitx_unit_format:nN {#1} \l__siunitx_symbol_tmpb_tl
41   \str_if_eq:VVTFF \l__siunitx_symbol_tmpa_tl \l__siunitx_symbol_tmpb_tl
42     {
43       \group_end:
44       \prg_return_true:
45     }
46     {
47       \group_end:
48       \prg_return_false:
49     }
50 }

```

(End definition for `_siunitx_symbol_if_replace:NnT`.)

At the start of the document, fonts are fixed and the user may have altered unit set up. If things are unchanged, we can alter the settings such that they use something “more sensible”.

```

51 \AtBeginDocument
52 {
53   \_siunitx_symbol_if_replace:NnT \arcminute { "02B9 }
54   {
55     \siunitx_declare_unit:Nn \arcminute
56     { \ensuremath { { } ' } }
57   }
58   \_siunitx_symbol_if_replace:NnT \arcsecond { "02BA }
59   {
60     \siunitx_declare_unit:Nn \arcsecond
61     { \ensuremath { { } '' } }
62   }

```

For `\degree`, direct input works in text mode so there is only a need to tidy up for math mode.

```

63   \_siunitx_symbol_if_replace:NnT \degree { "00B0 }
64   {
65     \siunitx_declare_unit:Nxn \degree
66     {
67       \exp_not:N \text
68       {
69         \@ifpackageloaded { inputenc }
70         { \exp_not:N \textdegree }
71         { \_siunitx_symbol_non_latin:n { "00B0 } }

```

```

72         }
73     }
74     { quantity-product = { } }
75 }

```

For `\degreeCelsius`, much the same to think about but the comparison must be done by hand.

```

76 \group_begin:
77   \tl_set:Nx \l__siunitx_symbol_tmpa_tl { \__siunitx_symbol_non_latin:n { "00B0 } C }
78   \protected@edef \l__siunitx_symbol_tmpa_tl
79     { \exp_not:N \mathrm { \l__siunitx_symbol_tmpa_tl } }
80   \keys_set:nn { siunitx } { parse-units = false }
81   \siunitx_unit_format:nN { \degreeCelsius } \l__siunitx_symbol_tmpb_tl
82   \str_if_eq:VTF \l__siunitx_symbol_tmpa_tl \l__siunitx_symbol_tmpb_tl
83     {

Part IX

siunitx-table – Formatting numbers in tables

1 Numbers in tables

This submodule is concerned with formatting numbers in table cells or similar fixed-width contexts. The main function, `\siunitx_cell_begin:w`, is designed to work with the normal $\text{\LaTeX} 2_{\epsilon}$ tabular cell construct featuring `\ignorespaces`. Therefore, if used outside of a $\text{\LaTeX} 2_{\epsilon}$ tabular, it is necessary to provide this token.

| | |
|------------------------------------|---|
| <code>\siunitx_cell_begin:w</code> | <code>\siunitx_cell_begin:w <preamble> \ignorespaces</code> |
| <code>\siunitx_cell_end:</code> | <code><content></code> <code>\siunitx_cell_end:</code> |

Collects the `<preamble>` and `<content>` tokens, and determines if it is text or a number (as parsed by `\siunitx_number_parse:nN`). It produces output of a fixed width suitable for alignment in a table, although it is not *required* that the code is used within a cell. Note that `\ignorespaces` must occur in the “cell”: it marks the end of the \TeX `\halign` template.

1.1 Key-value options

The options defined by this submodule are available within the `l3keys siunitx` tree.

| | |
|-------------------------------------|--|
| <code>table-align-comparator</code> | <code>table-align-comparator = true false</code> |
|-------------------------------------|--|

Switch which determines whether alignment of comparators is attempted within table cells. The standard setting is `true`.

| | |
|-----------------------------------|--|
| <code>table-align-exponent</code> | <code>table-align-exponent = true false</code> |
|-----------------------------------|--|

Switch which determines whether alignment of exponents is attempted within table cells. The standard setting is `true`.

| | |
|-------------------------------------|--|
| <code>table-align-text-after</code> | <code>table-align-text-after = true false</code> |
|-------------------------------------|--|

Switch which determines whether alignment of text falling after a number is attempted within table cells. The standard setting is `true`.

| | |
|--------------------------------------|---|
| <code>table-align-text-before</code> | <code>table-align-text-before = true false</code> |
|--------------------------------------|---|

Switch which determines whether alignment of text falling before a number is attempted within table cells. The standard setting is `true`.

| | |
|--------------------------------------|---|
| <code>table-align-uncertainty</code> | <code>table-align-uncertainty = true false</code> |
|--------------------------------------|---|

Switch which determines whether alignment of separated uncertainty values is attempted within table cells. The standard setting is `true`.

| | |
|-------------------------------|--|
| <u>table-alignment</u> | <p><code>table-alignment = center left right</code></p> <p>Selects the alignment of all tabular content with the margins of the table cell (or other boundary). See also <code>table-number-alignment</code> and <code>table-text-alignment</code>. The standard setting is <code>center</code>.</p> |
| <u>table-alignment-mode</u> | <p><code>table-alignment-mode = format marker none</code></p> <p>Selects the method used to align numbers with the desired position in the cell (set by <code>table-alignment</code>). When set to <code>format</code>, a dedicated amount of space is calculated from the <code>table-format</code>. When <code>marker</code> is selected, alignment is carried out symmetrically around the decimal marker. Finally, <code>none</code> switches off all alignment: numbers are parsed and formatted but with no attempt at placement within the cell. The standard setting is <code>marker</code>.</p> |
| <u>table-auto-round</u> | <p><code>table-auto-round = true false</code></p> <p>Switch which determines whether numbers are rounded to fit within the <code>table-format</code> specification (if possible). The standard setting is <code>false</code>.</p> |
| <u>table-column-width</u> | <p><code>table-column-width = <width></code></p> <p>Sets the width of the table column used for numbers. This is only used when <code>table-fixed-width</code> is <code>true</code>.</p> |
| <u>table-fixed-width</u> | <p><code>table-fixed-width = true false</code></p> <p>Switch which determines whether a fixed-width column is used for numbers in tables. When <code>true</code>, the width is taken from <code>table-column-width</code>. The standard setting is <code>false</code>.</p> |
| <u>table-format</u> | <p><code>table-format = <format></code></p> <p>Describes the amount of space that should be reserved when <code>table-alignment-mode</code> is set to <code>format</code>. The <code><format></code> takes the same general form as input for a table cell, with the numerical parts describing how many digits to reserve space for. For example, <code>1.2e3</code> would allow space for one digit in the integer part, two in the decimal part and three in the exponent part. Signs can be allowed for using any valid input sign, so for example <code>+1.2 \pm 1.2</code> would allow for a sign, a number with one integer and two decimal digits and an uncertainty of the same size.</p> |
| <u>table-number-alignment</u> | <p><code>table-number-alignment = center left right</code></p> <p>Selects the alignment of numerical content with the margins of the table cell (or other boundary). See also <code>table-alignment</code> and <code>table-text-alignment</code>. The standard setting is <code>center</code>.</p> |
| <u>table-text-alignment</u> | <p><code>table-text-alignment = center left none right</code></p> <p>Selects the alignment of non-numerical content with the margins of the table cell (or other boundary). See also <code>table-alignment</code> and <code>table-number-alignment</code>. Notice the additional support for <code>none</code> here. The standard setting is <code>center</code>.</p> |

2 siunitx-table implementation

Start the DocStrip guards.

```
1 <*package>
```

Identify the internal prefix (L^AT_EX3 DocStrip convention): only internal material in this *submodule* should be used directly.

```
2 <@@=siunitx_table>
```

Scratch space.

```

```
19       { \__siunitx_table_collect_end: }
```

```
20       { \__siunitx_table_direct_end: }
```

```
21   }
```

```
22 }
```

(End definition for `\siunitx_cell_begin:w` and `\siunitx_cell_end:`. These functions are documented on page [115](#).)

2.2 Collecting tokens

```
\l__siunitx_table_collect_tl
```

Space for tokens.

```
23 \tl_new:N \l__siunitx_table_collect_tl
```

(End definition for `\l__siunitx_table_collect_tl`.)

_siunitx_table_collect_begin:
_siunitx_table_collect_begin:w

Collecting a tabular cell means doing a token-by-token collection. In previous versions of `siunitx` that was done along with picking out the numerical part, but the code flow ends up very tricky. Here, therefore, we just collect up the unchanged tokens first. The definition of `\cr` is used to allow collection of any tokens inserted after the main content when dealing with the last cell of a row: the “group” around it is needed to avoid issues with the underlying `\halign`. (The approach is based on that in `colcell`.) Whilst the group formed by a cell will normally tidy up `\cr`, we add an extra one as the collected material could be a tabular in itself. We use an auxiliary to fish out the `\ignorespaces` from the template: that has to go to avoid issues with the peek-ahead code (everything before the `#` needs to be read *before* the Appendix D trick gets applied). Some packages add additional tokens before the `\ignorespaces`, which are dealt with by the delimited argument.

```

24 \cs_new_protected:Npn \__siunitx_table_collect_begin:
25 {
26   \group_begin:
27   \tl_clear:N \l__siunitx_table_collect_tl
28   \if_false: { \fi:
29     \cs_set_protected:Npn \cr
30     {
31       \__siunitx_table_collect_loop:
32       \tex_cr:D
33     }
34     \if_false: } \fi:
35     \__siunitx_table_collect_begin:w
36   }
37 \cs_new_protected:Npn \__siunitx_table_collect_begin:w #1 \ignorespaces
38 { \__siunitx_table_collect_loop: #1 }

(End definition for \__siunitx_table_collect_begin: and \__siunitx_table_collect_begin:w.)

```

_siunitx_table_collect_loop:
_siunitx_table_collect_group:n
_siunitx_table_collect_token:N
_siunitx_table_collect_token_aux:N
_siunitx_table_collect_relax:N
_siunitx_table_collect_search:NnF
_siunitx_table_collect_search_aux:NNn

Collecting up the cell content needs a loop: this is done using a `peek` approach as it’s most natural. (A slower approach is possible using something like the `\text_lowercase:n` loop code.) The set of possible tokens is somewhat limited compared to an arbitrary cell (*cf.* the approach in `colcell`): the special cases are pulled out for manual handling. The flexible lookup approach is more-or-less the same idea as in the kernel `case` functions. The `\relax` special case covers the case where `\\` has been expanded in an empty cell. This has to be an explicit token as we can get the same meaning from `\protect`.

```

39 \cs_new_protected:Npn \__siunitx_table_collect_loop:
40 {
41   \peek_catcode_ignore_spaces:NTF \c_group_begin_token
42   { \__siunitx_table_collect_group:n }
43   { \__siunitx_table_collect_token:N }
44 }
45 \cs_new_protected:Npn \__siunitx_table_collect_group:n #1
46 {

```

2.4 Printing numbers in cells: spacing

Getting the general alignment correct in tables is made more complex than one would like by the `colortbl` package. In the original L^AT_EX 2_ε definition, cell material is centred by a construction of the (primitive) form

```

\hfil
#
\hfil

```

which only uses `fil` stretch. That is altered by `colortbl` to broadly

```

\hskip 0pt plus 0.5fill
\kern 0pt
#
\hskip 0pt plus 0.5fill

```

which means there is `fill` stretch to worry about and the kern as well.

`__siunitx_table_skip:n` To prevent combination of skips, a kern is inserted after each one. This is best handled as a short auxiliary.

```

193 \cs_new_protected:Npn \__siunitx_table_skip:n #1
194 {
195   \skip_horizontal:n {#1}
196   \tex_kern:D \c_zero_skip
197 }
(End definition for \__siunitx_table_skip:n.)

```

`\l_siunitx_table_column_width_dim` Settings which apply to aligned columns in general.

```

\l_siunitx_table_fixed_width_bool
198 \dim_new:N \l_siunitx_table_column_width_dim
199 \keys_define:nn { siunitx }
200 {
201   table-column-width .code:n =
202   {
203     \dim_set:Nn \l_siunitx_table_column_width_dim {#1}
204     \dim_compare:nNnT \l_siunitx_table_column_width_dim > \c_zero_dim
205     { \bool_set_true:N \l_siunitx_table_fixed_width_bool }
206   } ,
207   table-fixed-width .bool_set:N =
208   \l_siunitx_table_fixed_width_bool
209 }
(End definition for \l_siunitx_table_column_width_dim and \l_siunitx_table_fixed_width_bool.)

```

`_siunitx_table_align_center:n`
`_siunitx_table_align_left:n`
`_siunitx_table_align_right:n`
`_siunitx_table_align_none:n`
`_siunitx_table_align_auxi:nn`
`_siunitx_table_align_auxii:nn`

The beginning and end of each table cell have to adjust the position of the content using glue. When `colortbl` is loaded the glue is done in two parts: one for our positioning and one to explicitly override that from the package. Using a two-step auxiliary chain avoids needing to repeat any code and the impact of the extra expansion should be trivial.

```

210 \cs_new_protected:Npn \_siunitx_table_align_center:n #1

248   { }
249 }

```

(End definition for `_siunitx_table_align_center:n` and others.)

2.5 Printing just text

In cases where there is no numerical part, `siunitx` allows alignment of the “escaped” text independent of the underlying column type.

`\l__siunitx_table_align_text_tl`

Alignment is handled using a `tl` as this allows a fast lookup at the point of use.

```

250 \keys_define:nn { siunitx }
251 {
252   table-text-alignment .choices:nn =
253     { center , left , right , none }
254     { \tl_set:Nn \l__siunitx_table_align_text_tl {#1} } ,
255   }
256 \tl_new:N \l__siunitx_table_align_text_tl

```

(End definition for \l__siunitx_table_align_text_tl.)

_siunitx_table_print_text:n Printing escaped text is easy: just place it in correctly in the column.

```

\_siunitx_table_print_text:V
257 \cs_new_protected:Npn \_siunitx_table_print_text:n #1
258 {
259   \bool_set_true:N \l__siunitx_table_text_bool
260   \use:c { \_siunitx_table_align \l__siunitx_table_align_text_tl :n } {#1}
261 }
262 \cs_generate_variant:Nn \_siunitx_table_print_text:n { V }

```

(End definition for _siunitx_table_print_text:n.)

2.6 Number alignment: core ideas

\l__siunitx_table_integer_box Boxes for the content before and after the decimal marker.

```

\_siunitx_table_decimal_box
263 \box_new:N \l__siunitx_table_integer_box
264 \box_new:N \l__siunitx_table_decimal_box

```

(End definition for \l__siunitx_table_integer_box and \l__siunitx_table_decimal_box.)

_siunitx_table_fil: Primitives renamed.

```

\_siunitx_table_fill:
265 \cs_new_eq:NN \_siunitx_table_fil: \tex_hfil:D
266 \cs_new_eq:NN \_siunitx_table_fill: \tex_hfill:D

```

(End definition for _siunitx_table_fil: and _siunitx_table_fill:.)

_siunitx_table_cleanup_decimal:w To remove the excess marker tokens in a decimal part.

```

267 \cs_new:Npn \_siunitx_table_cleanup_decimal:w
268   #1 \q_nil #2 \q_nil #3 \q_nil #4 \q_nil #5 \q_nil #6 \q_nil #7 \q_nil
269   { #1#2#3#4#5#6#7 }

```

(End definition for _siunitx_table_cleanup_decimal:w.)

_siunitx_table_color_check:N Handle the fact that splitting a number can leave a negative color dangling.

```

\_siunitx_table_color_check:w
\_siunitx_table_color_check:Nnw
270 \cs_new_protected:Npn \_siunitx_table_color_check:N #1
271 { \exp_after:wN \_siunitx_table_color_check:w #1 \q_stop }

```

`__siunitx_table_generate_model:n` Creating a model for a table at this stage means parsing the format and converting that to an appropriate model. Things are quite straight-forward other than the uncertainty part. At this stage there is no point in formatting the model: that has to happen at point-of-use. Notice that the uncertainty part needs to allow for the case where we cross the decimal.

2.7 Directly printing without collection

Collecting the number allows for various effects but is not as fast as simply aligning on the first token that is a decimal marker. The strategy here is that used by dcolumn.

After removing the \ignorespaces at the start of the cell (see comments for __siunitx_table_collect_begin:N), check to see if there is a { and branch as appropriate.

```

\__siunitx_table_direct_begin:
\__siunitx_table_direct_begin:w
\__siunitx_table_direct_end:
\__siunitx_table_direct_marker:
\__siunitx_table_direct_marker_switch:

```

When centring the content about a decimal marker, the trick is to collect everything into two boxes and then compare the sizes. As we are always in math mode, we can use a math active token to make the switch. The up-front setting of the decimal box deals with the case where there is no decimal part.

515 }

(End definition for \l__siunitx_table_align_comparator_bool and others.)

```

`__siunitx_table_print:nnn`

`__siunitx_table_print:VVV`

```

516 \cs_new_protected:Npn \__siunitx_table_print:nnn #1#2#3
517 { \use:c { __siunitx_table_print_ \l__siunitx_table_align_mode_tl :nnn } {#1} {#2} {#3} }
518 \cs_generate_variant:Nn \__siunitx_table_print:nnn { VVV }

```

When centering on the decimal marker, alignment is relatively simple, and close in concept to that used without parsing. First we need to deal with any text before or after the number. For text *before*, there’s the case where it has no width and might be a font or color change: that has to be filtered out first. Then we can adjust the size of this material and that after the number such that they are equal. The number itself can then be formatted, splitting at the decimal marker. A bit more size adjustment, then the number itself and any text at the end can be inserted.

```

```

For positioning based on a format, we have to work part-by-part as there are a number of alignment points to get right. As for the `marker` approach, first we check if the material before the numerical content is of zero width. Next we need to format the model and content numbers, before starting an auxiliary chain to pick out the various parts in

order. We have to carry the amount of space for the non-numerical material before the cell forward: this may end up being enlarged by unused parts of the integer.

658 }
```

The integer part follows much the same pattern, except now it is control of the comparator alignment that determines where the white space goes. As we already have content in the `integer` box, we need to measure how much *extra* material has been added. To avoid using more boxes or re-setting, we do that by recording sizes before and after the change. (In effect, `\l__siunitx_table_tmp_dim` is here “`\l__@@_comparator_dim`”.) As the integer part is completed here, we are able to finalise the width of the pre-numeral part, reboxing it to have the correct width and possibly to force a single overfull warning if appropriate.

803 {
804     \use:c { __siunitx_table_align_ \l__siunitx_table_align_number_tl :n }
805     {
806         #1
807         \siunitx_number_format:nN {#2} \l__siunitx_table_tmp_tl
808         \siunitx_print_number:V \l__siunitx_table_tmp_tl
809         #3
810     }
811 }

```

(End definition for `__siunitx_table_print:nnn` and others.)

2.9 Standard settings for module options

Some of these follow naturally from the point of definition (*e.g.* boolean variables are always `false` to begin with), but for clarity everything is set here.

```
812 \keys_set:nn { siunitx }
813 {
814   table-align-comparator = true   ,
815   table-align-exponent   = true   ,
816   table-align-text-after  = true   ,
817   table-align-text-before = true   ,
818   table-align-uncertainty = true   ,
819   table-alignment         = center ,
820   table-auto-round        = false  ,
821   table-column-width      = Opt    ,
822   table-fixed-width       = false  ,
823   table-format            = 2.2    ,
824   table-number-alignment  = center ,
825   table-text-alignment    = center ,
```

Out of order as `table-format` sets this implicitly too.

```
826   table-alignment-mode    = marker
827 }
828 \endpackage
```

Part X

siunitx-unit – Parsing and formatting units

This submodule is dedicated to formatting physical units. The main function, `\siunitx-unit_format:nN`, takes user input specify physical units and converts it into a formatted token list suitable for typesetting in math mode. While the formatter will deal correctly with “literal” user input, the key strength of the module is providing a method to describe physical units in a “symbolic” manner. The output format of these symbolic units can then be controlled by a number of key–value options made available by the module.

A small number of L^AT_EX 2_ε math mode commands are assumed to be available as part of the formatted output. The `\mathchoice` command (normally the T_EX primitive) is needed when using `per-mode = symbol-or-fraction`. The commands `\frac`, `\mathrm`, `\mbox`, `_` and `\,` are used by the standard module settings. For the display of colored (highlighted) and cancelled units, the commands `\textcolor` and `\cancel` are assumed to be available.

1 Formatting units

`\siunitx_unit_format:nN`
`\siunitx_unit_format:xN`

`\siunitx_unit_format:nN {<units>} <tl var>`

This function converts the input `<units>` into a processed `<tl var>` which can then be inserted in math mode to typeset the material. Where the `<units>` are given in symbolic form, described elsewhere, this formatting process takes place in two stages: the `<units>` are parsed into a structured form before the generation of the appropriate output form based on the active settings. When the `<units>` are given as literals, processing is minimal: the characters `.` and `~` are converted to unit products (boundaries). In both cases, the result is a series of tokens intended to be typeset in math mode with appropriate choice of font for typesetting of the textual parts.

For example,

```
\siunitx_unit_format:nN { \kilo \metre \per \second } \l_tmpa_tl
```

will, with standard settings, result in `\l_tmpa_tl` being set to

```
\mathrm{km}\,,\mathrm{s}^{-1}
```

| | |
|--|--|
| <code>\siunitx_unit_format_extract_prefixes:nnN</code> | <code>\siunitx_unit_format_extract_prefixes:nnN {<units>} <tl var> <fp var></code> |
|--|--|

This function formats the $\langle units \rangle$ in the same way as described for `\siunitx_unit_format:nN`. When the input is given in symbolic form, any decimal unit prefixes will be extracted and the overall power of ten that these represent will be stored in the $\langle fp var \rangle$.

For example,

```
\siunitx_unit_format_extract_prefixes:nnN { \kilo \metre \per \second }
\l_tmpa_tl \l_tmpa_fp
```

will, with standard settings, result in `\l_tmpa_tl` being set to

```
\mathrm{m}\,,\mathrm{s}^{-1}
```

with `\l_tmpa_fp` taking value 3. Note that the latter is a floating point variable: it is possible for non-integer values to be obtained here.

| | |
|--|--|
| <code>\siunitx_unit_format_combine_exponent:nnN</code> | <code>\siunitx_unit_format_combine_exponent:nnN {<units>} <exponent> <tl var></code> |
|--|--|

This function formats the $\langle units \rangle$ in the same way as described for `\siunitx_unit_format:nN`. The $\langle exponent \rangle$ is combined with any prefix for the *first* unit of the $\langle units \rangle$, and an updated prefix is introduced.

For example,

```
\siunitx_unit_format_combine_exponent:nnN { \metre \per \second }
{ 3 } \l_tmpa_tl
```

will, with standard settings, result in `\l_tmpa_tl` being set to

```
\mathrm{km}\,,\mathrm{s}^{-1}
```

| | |
|--|--|
| <code>\siunitx_unit_format_multiply:nnN</code> <code>\siunitx_unit_format_multiply_extract_prefixes:nnNN</code> <code>\siunitx_unit_format_multiply_combine_exponent:nnnN</code> | <code>\siunitx_unit_format_multiply:nnN {<units>} <factor> <tl var></code> <code>\siunitx_unit_format_multiply_extract_prefixes:nnNN {<units>} <factor> <tl var> <fp var></code> <code>\siunitx_unit_format_multiply_combine_exponent:nnnN {<units>} <factor> <exponent> <tl var></code> |
|--|--|

These function formats the $\langle units \rangle$ in the same way as described for `\siunitx_unit_format:nN`. The units are multiplied by the $\langle factor \rangle$, and further processing takes place as previously described.

For example,

```
\siunitx_unit_format_multiply:nnN { \metre \per \second }
{ 3 } \l_tmpa_tl
```

will, with standard settings, result in `\l_tmpa_tl` being set to

```
\mathrm{km}^3\,,\mathrm{s}^{-3}
```

2 Defining symbolic units

| | |
|--|--|
| <code>\siunitx_declare_prefix:Nnn</code> | <code>\siunitx_declare_prefix:Nnn <prefix> {<power>} {<symbol>}</code> |
| <code>\siunitx_declare_prefix:Nnx</code> | |

Defines a symbolic $\langle prefix \rangle$ (which should be a control sequence such as `\kilo`) to be converted by the parser to the $\langle symbol \rangle$. The latter should consist of literal content (e.g. `k`). In literal mode the $\langle symbol \rangle$ will be typeset directly. The prefix should represent an integer $\langle power \rangle$ of 10, and this information may be used to convert from one or more $\langle prefix \rangle$ symbols to an overall power applying to a unit. See also `\siunitx_declare_prefix:Nn`.

| | |
|---|---|
| <code>\siunitx_declare_prefix:Nn</code> | <code>\siunitx_declare_prefix:Nn <prefix> {<symbol>}</code> |
|---|---|

Defines a symbolic $\langle prefix \rangle$ (which should be a control sequence such as `\kilo`) to be converted by the parser to the $\langle symbol \rangle$. The latter should consist of literal content (e.g. `k`). In literal mode the $\langle symbol \rangle$ will be typeset directly. In contrast to `\siunitx_declare_prefix:Nnn`, there is no assumption about the mathematical nature of the $\langle prefix \rangle$, i.e. the prefix may represent a power of any base. As a result, no conversion of the $\langle prefix \rangle$ to a numerical power will be possible.

| | |
|---|--|
| <code>\siunitx_declare_power:NNn</code> | <code>\siunitx_declare_power:NNn <pre-power> <post-power> {<value>}</code> |
|---|--|

Defines *two* symbolic $\langle powers \rangle$ (which should be control sequences such as `\squared`) to be converted by the parser to the $\langle value \rangle$. The latter should be an integer or floating point number in the format defined for `l3fp`. Powers may precede a unit or be give after it: both forms are declared at once, as indicated by the argument naming. In literal mode, the $\langle value \rangle$ will be applied as a superscript to either the next token in the input (for the $\langle pre-power \rangle$) or appended to the previously-typeset material (for the $\langle post-power \rangle$).

| | |
|--|--|
| <code>\siunitx_declare_qualifier:Nn</code> | <code>\siunitx_declare_qualifier:Nn <qualifier> {<meaning>}</code> |
|--|--|

Defines a symbolic $\langle qualifier \rangle$ (which should be a control sequence such as `\catalyst`) to be converted by the parser to the $\langle meaning \rangle$. The latter should consist of literal content (e.g. `cat`). In literal mode the $\langle meaning \rangle$ will be typeset following a space after the unit to which it applies.

| | |
|--|---|
| <code>\siunitx_declare_unit:Nn</code> | <code>\siunitx_declare_unit:Nn <unit> {<meaning>}</code> |
| <code>\siunitx_declare_unit:Nx</code> | <code>\siunitx_declare_unit:Nnn <unit> {<meaning>} {<options>}</code> |
| <code>\siunitx_declare_unit:Nnn</code> | |
| <code>\siunitx_declare_unit:Nxn</code> | |

Defines a symbolic $\langle unit \rangle$ (which should be a control sequence such as `\kilogram`) to be converted by the parser to the $\langle meaning \rangle$. The latter may consist of literal content (e.g. `kg`), other symbolic unit commands (e.g. `\kilo\gram`) or a mixture of the two. In literal mode the $\langle meaning \rangle$ will be typeset directly. The version taking an $\langle options \rangle$ argument may be used to support per-unit options: these are applied at the top level or using `\siunitx_unit_options_apply:n`.

| | |
|--------------------------------------|---|
| <code>\l_siunitx_unit_font_tl</code> | The font function which is applied to the text of units when constructing formatted units: set by <code>font-command</code> . |
|--------------------------------------|---|

`\l_siunitx_unit_fraction_tl`

The fraction function which is applied when constructing fractional units: set by `fraction-command`.

`\l_siunitx_unit_symbolic_seq`

This sequence contains all of the symbolic names defined: these will be in the form of control sequences such as `\kilogram`. The order of the sequence is unimportant. This includes prefixes and powers as well as units themselves.

`\l_siunitx_unit_seq`

This sequence contains all of the symbolic *unit* names defined: these will be in the form of control sequences such as `\kilogram`. In contrast to `\l_siunitx_unit_symbolic_seq`, it *only* holds units themselves

3 Per-unit options

`\siunitx_unit_options_apply:n` `\siunitx_unit_options_apply:n <unit(s)>`

Applies any unit-specific options set up using `\siunitx_declare_unit:Nnn`. This allows their use outside of unit formatting, for example to influence spacing in quantities. The options are applied only once at a given group level, which allows for user over-ride *via* `\keys_set:nn { siunitx } { ... }`.

4 Units in (PDF) strings

`\siunitx_unit_pdfstring_context:` `\group_begin:`
`\siunitx_unit_pdfstring_context:`
`<Expansion context> <units>`
`\group_end:`

Sets symbol unit macros to generate text directly. This is needed in expansion contexts where units must be converted to simple text. This function is itself not expandable, so must be used within a surrounding group as shown in the example.

5 Pre-defined symbolic unit components

The unit parser is defined to recognise a number of pre-defined units, prefixes and powers, and also interpret a small selection of “generic” symbolic parts.

Broadly, the pre-defined units are those defined by the BIPM in the documentation for the *International System of Units* (SI) [1]. As far as possible, the names given to the command names for units are those used by the BIPM, omitting spaces and using only ASCII characters. The standard symbols are also taken from the same documentation. In the following documentation, the order of the description of units broadly follows the SI Brochure.

| | |
|------------------------|---|
| <code>\kilogram</code> | The base units as defined in the SI Brochure [2]. Notice that <code>\meter</code> is defined as an alias for <code>\metre</code> as the former spelling is common in the US (although the latter is the official spelling). |
| <code>\metre</code> | |
| <code>\meter</code> | |
| <code>\mole</code> | |
| <code>\kelvin</code> | |
| <code>\candela</code> | |
| <code>\second</code> | |
| <code>\ampere</code> | |

| | |
|--------------------|--|
| <code>\gram</code> | The base unit <code>\kilogram</code> is defined using an SI prefix: as such the (derived) unit <code>\gram</code> is required by the module to correctly produce output for the <code>\kilogram</code> . |
|--------------------|--|

| | |
|---------------------|--|
| <code>\yocto</code> | Prefixes, all of which are integer powers of 10: the powers are stored internally by the module and can be used for conversion from prefixes to their numerical equivalent. These prefixes are documented in Section 3.1 of the SI Brochure. |
| <code>\zepto</code> | |
| <code>\atto</code> | Note that the <code>\kilo</code> prefix is required to define the base <code>\kilogram</code> unit. Also note the two spellings available for <code>\deca</code> / <code>\deka</code> . |
| <code>\femto</code> | |
| <code>\pico</code> | |
| <code>\nano</code> | |
| <code>\micro</code> | |
| <code>\milli</code> | |
| <code>\centi</code> | |
| <code>\deci</code> | |
| <code>\deca</code> | |
| <code>\deka</code> | |
| <code>\hecto</code> | |
| <code>\kilo</code> | |
| <code>\mega</code> | |
| <code>\giga</code> | |
| <code>\tera</code> | |
| <code>\peta</code> | |
| <code>\exa</code> | |
| <code>\zetta</code> | |
| <code>\yotta</code> | |

| | |
|--|---|
| <hr/> <code>\becquerel</code> <code>\degreeCelsius</code> <code>\coulomb</code> <code>\farad</code> <code>\gray</code> <code>\hertz</code> <code>\henry</code> <code>\joule</code> <code>\katal</code> <code>\lumen</code> <code>\lux</code> <code>\newton</code> <code>\ohm</code> <code>\pascal</code> <code>\radian</code> <code>\siemens</code> <code>\sievert</code> <code>\steradian</code> <code>\tesla</code> <code>\volt</code> <code>\watt</code> <code>\weber</code> <hr/> | <p>The defined SI units with defined names and symbols, as given in Table 4 of the SI Brochure. Notice that the names of the units are lower case with the exception of <code>\degreeCelsius</code>, and that this unit name includes “degree”.</p> |
| <hr/> <code>\astronomicalunit</code> <code>\bel</code> <code>\dalton</code> <code>\day</code> <code>\decibel</code> <code>\electronvolt</code> <code>\hectare</code> <code>\hour</code> <code>\litre</code> <code>\liter</code> <code>\neper</code> <code>\minute</code> <code>\tonne</code> <hr/> | <p>Units accepted for use with the SI: here <code>\minute</code> is a unit of time not of plane angle. These units are taken from Table 8 of the SI Brochure.</p> <p>For the unit <code>\litre</code>, both <code>l</code> and <code>L</code> are listed as acceptable symbols: the latter is the standard setting of the module. The alternative spelling <code>\liter</code> is also given for this unit for US users (as with <code>\metre</code>, the official spelling is “re”).</p> |
| <hr/> <code>\arcminute</code> <code>\arcsecond</code> <code>\degree</code> <hr/> | <p>Units for plane angles accepted for use with the SI: to avoid a clash with units for time, here <code>\arcminute</code> and <code>\arcsecond</code> are used in place of <code>\minute</code> and <code>\second</code>. These units are taken from Table 8 of the SI Brochure.</p> |
| <hr/> <code>\percent</code> <hr/> | <p>The mathematical concept of percent, usable with the SI as detailed in Section 5.4.7 of the SI Brochure.</p> |
| <hr/> <code>\square</code> <code>\cubic</code> <hr/> | <p><code>\square</code> $\langle prefix \rangle \langle unit \rangle$ <code>\cubic</code> $\langle prefix \rangle \langle unit \rangle$</p> <p>Pre-defined unit powers which apply to the next $\langle prefix \rangle / \langle unit \rangle$ combination.</p> |

| | |
|-------|--|
| <hr/> | $\langle prefix \rangle \langle unit \rangle \backslash squared$ |
| <hr/> | $\langle prefix \rangle \langle unit \rangle \backslash cubed$ |

Pre-defined unit powers which apply to the preceding $\langle prefix \rangle / \langle unit \rangle$ combination.

| | |
|-------|--|
| <hr/> | $\backslash per \langle prefix \rangle \langle unit \rangle \langle power \rangle$ |
|-------|--|

Indicates that the next $\langle prefix \rangle / \langle unit \rangle / \langle power \rangle$ combination is reciprocal, *i.e.* raises it to the power -1 . This symbolic representation may be applied in addition to a $\backslash power$, and will work correctly if the $\backslash power$ itself is negative. In literal mode $\backslash per$ will print a slash (“/”).

| | |
|-------|---|
| <hr/> | $\backslash cancel \langle prefix \rangle \langle unit \rangle \langle power \rangle$ |
|-------|---|

Indicates that the next $\langle prefix \rangle / \langle unit \rangle / \langle power \rangle$ combination should be “cancelled out”. In the parsed output, the entire unit combination will be given as the argument to a function $\backslash cancel$, which is assumed to be available at a higher level. In literal mode, the same higher-level $\backslash cancel$ will be applied to the next token. It is the responsibility of the calling code to provide an appropriate definition for $\backslash cancel$ outside of the scope of the unit parser.

| | |
|-------|--|
| <hr/> | $\backslash highlight \{ \langle color \rangle \} \langle prefix \rangle \langle unit \rangle \langle power \rangle$ |
|-------|--|

Indicates that the next $\langle prefix \rangle / \langle unit \rangle / \langle power \rangle$ combination should be highlighted in the specified $\langle color \rangle$. In the parsed output, the entire unit combination will be given as the argument to a function $\backslash textcolor$, which is assumed to be available at a higher level. In literal mode, the same higher-level $\backslash textcolor$ will be applied to the next token. It is the responsibility of the calling code to provide an appropriate definition for $\backslash textcolor$ outside of the scope of the unit parser.

| | |
|-------|---|
| <hr/> | $\langle prefix \rangle \langle unit \rangle \langle power \rangle \backslash of \{ \langle qualifier \rangle \}$ |
|-------|---|

Indicates that the $\langle qualifier \rangle$ applies to the current $\langle prefix \rangle / \langle unit \rangle / \langle power \rangle$ combination. In parsed mode, the display of the result will depend upon module options. In literal mode, the $\langle qualifier \rangle$ will be printed in parentheses following the preceding $\langle unit \rangle$ and a full-width space.

| | |
|-------|--|
| <hr/> | $\backslash raiseto \{ \langle power \rangle \} \langle prefix \rangle \langle unit \rangle$ |
| <hr/> | $\langle prefix \rangle \langle unit \rangle \backslash tothe \{ \langle power \rangle \}$ |

Indicates that the $\langle power \rangle$ applies to the current $\langle prefix \rangle / \langle unit \rangle$ combination. As shown, $\backslash raiseto$ applies to the next $\langle unit \rangle$ whereas $\backslash tothe$ applies to the preceding unit. In literal mode the $\backslash power$ will be printed as a superscript attached to the next token ($\backslash raiseto$) or preceding token ($\backslash tothe$) as appropriate.

5.1 Key-value options

The options defined by this submodule are available within the l3keys siunitx tree.

| | |
|-------|---|
| <hr/> | $\text{bracket-unit-denominator} = \text{true false}$ |
|-------|---|

Switch to determine whether brackets are added to the denominator part of a unit when printed using inline fractional form (with per-mode as repeated-symbol , symbol or $\text{symbol-or-fraction}$). The standard setting is true .

| | |
|----------------------------------|--|
| <u>extract-mass-in-kilograms</u> | <p><code>extract-mass-in-kilograms = true false</code></p> <p>Determines whether prefix extraction treats kilograms as a base unit; when set false, grams are used. The standard setting is true.</p> |
| <u>forbid-literal-units</u> | <p><code>forbid-literal-units = true false</code></p> <p>Switch which determines if literal units are allowed when parsing is active; does not apply when parse-units is false.</p> |
| <u>fraction-command</u> | <p><code>fraction-command = \langlecommand\rangle</code></p> <p>Command used to create fractional output when per-mode is set to fraction. The standard setting is <code>\frac</code>.</p> |
| <u>inter-unit-product</u> | <p><code>inter-unit-product = \langleseparator\rangle</code></p> <p>Inserted between unit combinations in parsed mode, and used to replace <code>.</code> and <code>~</code> in literal mode. The standard setting is <code>\,</code>.</p> |
| <u>parse-units</u> | <p><code>parse-units = true false</code></p> <p>Determines whether parsing of unit symbols is attempted or literal mode is used directly. The standard setting is true.</p> |
| <u>per-mode</u> | <p><code>per-mode =</code> <code>fraction power power-positive-first repeated-symbol symbol symbol-or-fraction</code></p> <p>Selects how the negative powers (<code>\per</code>) are formatted: a choice from the options fraction, power, power-positive-first, repeated-symbol, symbol and symbol-or-fraction. The option fraction generates fractional output when appropriate using the command specified by the fraction-command option. The setting power uses reciprocal powers leaving the units in the order of input, while power-positive-first uses the same display format but sorts units such that the positive powers come before negative ones. The symbol setting uses a symbol (specified by per-symbol) between positive and negative powers, while repeated-symbol uses the same symbol but places it before <i>every</i> unit with a negative power (this is mathematically “wrong” but often seen in real work). Finally, symbol-or-fraction acts like symbol for inline output and like fraction when the output is used in a display math environment. The standard setting is power.</p> |
| <u>per-symbol</u> | <p><code>per-symbol = \langlesymbol\rangle</code></p> <p>Specifies the symbol to be used to denote negative powers when the option per-mode is set to repeated-symbol, symbol or symbol-or-fraction. The standard setting is <code>/</code>.</p> |
| <u>qualifier-mode</u> | <p><code>qualifier-mode = bracket combine phrase subscript</code></p> <p>Selects how qualifiers are formatted: a choice from the options bracket, combine, phrase and subscript. The option bracket wraps the qualifier in parenthesis, combine joins the qualifier with the unit directly, phrase joins the material using qualifier-phrase as a link, and subscript formats the qualifier as a subscript. The standard setting is subscript.</p> |
| <u>qualifier-phrase</u> | <p><code>qualifier-phrase = \langlephrase\rangle</code></p> <p>Defines the \langle<i>phrase</i>\rangle used when qualifier-mode is set to phrase.</p> |

sticky-per `sticky-per = true|false`

Used to determine whether `\per` should be applied one a unit-by-unit basis (when `false`) or should apply to all following units (when `true`). The latter mode is somewhat akin conceptually to the T_EX `\over` primitive. The standard setting is `false`.

unit-font-command `unit-font-command = <command>`

Command applied to text during output of units: should be command usable in math mode for font selection. Notice that in a typical unit this does not (necessarily) apply to all output, for example powers or brackets. The standard setting is `\mathrm`.

6 siunitx-unit implementation

Start the DocStrip guards.

```
1 \*package
```

Identify the internal prefix (L^AT_EX3 DocStrip convention): only internal material in this *submodule* should be used directly.

```
2 \@@=siunitx_unit
```

6.1 Initial set up

The mechanisms defined here need a few variables to exist and to be correctly set: these don't belong to one subsection and so are created in a small general block.

Variants not provided by expl3.

```
3 \cs_generate_variant:Nn \tl_replace_all:Nnn { NnV }
```

`\l__siunitx_unit_tmp_fp` Scratch space.

```
\l__siunitx_unit_tmp_int    4 \fp_new:N \l__siunitx_unit_tmp_fp
\l__siunitx_unit_tmp_tl    5 \int_new:N \l__siunitx_unit_tmp_int
                             6 \tl_new:N \l__siunitx_unit_tmp_tl
```

(End definition for `\l__siunitx_unit_tmp_fp`, `\l__siunitx_unit_tmp_int`, and `\l__siunitx_unit_tmp_tl`.)

`\c__siunitx_unit_math_subscript_tl` Useful tokens with awkward category codes.

```
7 \tl_const:Nx \c__siunitx_unit_math_subscript_tl
8 { \char_generate:nn { '\_ } { 8 } }
```

(End definition for `\c__siunitx_unit_math_subscript_tl`.)

`\l__siunitx_unit_parsing_bool` A boolean is used to indicate when the symbolic unit functions should produce symbolic or literal output. This is used when the symbolic names are used along with literal input, and ensures that there is a sensible fall-back for these cases.

```
9 \bool_new:N \l__siunitx_unit_parsing_bool
```

(End definition for `\l__siunitx_unit_parsing_bool`.)

`\l__siunitx_unit_test_bool` A switch used to indicate that the code is testing the input to find if there is any typeset output from individual unit macros. This is needed to allow the “base” macros to be found, and also to pick up the difference between symbolic and literal unit input.

```
10 \bool_new:N \l__siunitx_unit_test_bool
```

(End definition for `\l__siunitx_unit_test_bool`.)

`__siunitx_unit_if_symbolic:nTF`

The test for symbolic units is needed in two places. First, there is the case of “pre-parsing” input to check if it can be parsed. Second, when parsing there is a need to check if the current unit is built up from others (symbolic) or is defined in terms of some literals. To do this, the approach used is to set all of the symbolic unit commands expandable and to do nothing, with the few special cases handled manually.

```

11 \prg_new_protected_conditional:Npnn \__siunitx_unit_if_symbolic:n #1 { TF }
12   {
13     \group_begin:
14       \bool_set_true:N \l__siunitx_unit_test_bool
15       \protected@edef \l__siunitx_unit_tmp_tl {#1}
16       \exp_args:NNV \group_end:
17       \tl_if_blank:nTF \l__siunitx_unit_tmp_tl
18         { \prg_return_true: }
19         { \prg_return_false: }
20   }

```

(End definition for `__siunitx_unit_if_symbolic:nTF`.)

6.2 Defining symbolic unit

Unit macros and related support are created here. These exist only within the scope of the unit processor code, thus not polluting document-level namespace and allowing overlap with other areas in the case of useful short names (for example `\pm`). Setting up the mechanisms to allow this requires a few additional steps on top of simply saving the data given by the user in creating the unit.

`\l_siunitx_unit_symbolic_seq`

A list of all of the symbolic units, *etc.*, set up. This is needed to allow the symbolic names to be defined within the scope of the unit parser but not elsewhere using simple mappings.

```

21 \seq_new:N \l_siunitx_unit_symbolic_seq

```

(End definition for `\l_siunitx_unit_symbolic_seq`. This variable is documented on page 141.)

`\l_siunitx_unit_seq`

A second list featuring only the units themselves.

```

22 \seq_new:N \l_siunitx_unit_seq

```

(End definition for `\l_siunitx_unit_seq`. This variable is documented on page 141.)

`__siunitx_unit_set_symbolic:Nnn`

`__siunitx_unit_set_symbolic:Npnn`

`__siunitx_unit_set_symbolic:Nnnn`

The majority of the work for saving each symbolic definition is the same irrespective of the item being defined (unit, prefix, power, qualifier). This is therefore all carried out in a single internal function which does the common tasks. The three arguments here are the symbolic macro name, the literal output and the code to insert when doing full unit parsing. To allow for the “special cases” (where arguments are required) the entire mechanism is set up in a two-part fashion allowing for flexibility at the slight cost of additional functions.

Importantly, notice that the unit macros are declared as expandable. This is required so that literals can be correctly converted into a token list of material which does not depend on local redefinitions for the unit macros. That is required so that the unit formatting system can be grouped.

```

23 \cs_new_protected:Npn \__siunitx_unit_set_symbolic:Nnn #1
24   { \__siunitx_unit_set_symbolic:Nnnn #1 { } }

```

```

25 \cs_new_protected:Npn \__siunitx_unit_set_symbolic:Npnn #1#2#
26 { \__siunitx_unit_set_symbolic:Nnnn #1 {#2} }
27 \cs_new_protected:Npn \__siunitx_unit_set_symbolic:Nnnn #1#2#3#4
28 {
29   \seq_put_right:Nn \l_siunitx_unit_symbolic_seq {#1}
30   \cs_set:cpn { \__siunitx_unit_ \token_to_str:N #1 :w } #2
31   {
32     \bool_if:NF \l_siunitx_unit_test_bool
33     {
34       \bool_if:NTF \l_siunitx_unit_parsing_bool
35       {#4}
36       {#3}
37     }
38   }
39 }

```

(End definition for `__siunitx_unit_set_symbolic:Nnn`, `__siunitx_unit_set_symbolic:Npnn`, and `__siunitx_unit_set_symbolic:Nnnn`.)

`\siunitx_declare_power:Nn` Powers can come either before or after the unit. As they always come (logically) in matching, we handle this by declaring two commands, and setting each up separately.

```

40 \cs_new_protected:Npn \siunitx_declare_power:Nn #1#2#3
41 {
42   \__siunitx_unit_set_symbolic:Nnn #1
43   { \__siunitx_unit_literal_power:nn {#3} }
44   { \__siunitx_unit_parse_power:nnN {#1} {#3} \c_true_bool }
45   \__siunitx_unit_set_symbolic:Nnn #2
46   { ^ {#3} }
47   { \__siunitx_unit_parse_power:nnN {#2} {#3} \c_false_bool }
48 }

```

(End definition for `\siunitx_declare_power:Nn`. This function is documented on page 140.)

`\siunitx_declare_prefix:Nn` For prefixes there are a couple of options. In all cases, the basic requirement is to set up to parse the prefix using the appropriate internal function. For prefixes which are powers of 10, there is also the need to be able to do conversion to/from the numerical equivalent. That is handled using two properly lists which can be used to supply the conversion data later.

```

49 \cs_new_protected:Npn \siunitx_declare_prefix:Nn #1#2
50 {
51   \__siunitx_unit_set_symbolic:Nnn #1
52   {#2}
53   { \__siunitx_unit_parse_prefix:Nn #1 {#2} }
54 }
55 \cs_new_protected:Npn \siunitx_declare_prefix:Nnn #1#2#3
56 {
57   \siunitx_declare_prefix:Nn #1 {#3}
58   \prop_put:Nnn \l__siunitx_unit_prefixes_forward_prop {#3} {#2}
59   \prop_put:Nnn \l__siunitx_unit_prefixes_reverse_prop {#2} {#3}
60 }
61 \cs_generate_variant:Nn \siunitx_declare_prefix:Nnn { Nnx }
62 \prop_new:N \l__siunitx_unit_prefixes_forward_prop
63 \prop_new:N \l__siunitx_unit_prefixes_reverse_prop

```

(End definition for `\siunitx_declare_prefix:Nn` and others. These functions are documented on page 140.)

`\siunitx_declare_qualifier:Nn` Qualifiers are relatively easy to handle: nothing to do other than save the input appropriately.

```

64 \cs_new_protected:Npn \siunitx_declare_qualifier:Nn #1#2
65 {
66   \__siunitx_unit_set_symbolic:Nnn #1
67   { ~ ( #2 ) }
68   { \__siunitx_unit_parse_qualifier:nn {#1} {#2} }
69 }

```

(End definition for `\siunitx_declare_qualifier:Nn`. This function is documented on page 140.)

`\siunitx_declare_unit:Nn` For the unit parsing, allowing for variations in definition order requires that a test is made for the output of each unit at point of use.

```

\siunitx_declare_unit:Nx
\siunitx_declare_unit:Nnn
\siunitx_declare_unit:Nxn
70 \cs_new_protected:Npn \siunitx_declare_unit:Nn #1#2
71 { \siunitx_declare_unit:Nnn #1 {#2} { } }
72 \cs_generate_variant:Nn \siunitx_declare_unit:Nn { Nx }
73 \cs_new_protected:Npn \siunitx_declare_unit:Nnn #1#2#3
74 {
75   \seq_put_right:Nn \l_siunitx_unit_seq {#1}
76   \__siunitx_unit_set_symbolic:Nnn #1
77   {#2}
78   {
79     \__siunitx_unit_if_symbolic:nTF {#2}
80     {#2}
81     { \__siunitx_unit_parse_unit:Nn #1 {#2} }
82   }
83   \tl_clear_new:c { l__siunitx_unit_options_ \token_to_str:N #1 _tl }
84   \tl_if_empty:nF {#3}
85   { \tl_set:cn { l__siunitx_unit_options_ \token_to_str:N #1 _tl } {#3} }
86 }
87 \cs_generate_variant:Nn \siunitx_declare_unit:Nnn { Nx }

```

(End definition for `\siunitx_declare_unit:Nn` and `\siunitx_declare_unit:Nnn`. These functions are documented on page 140.)

6.3 Applying unit options

`\l_siunitx_unit_options_bool`

```

88 \bool_new:N \l__siunitx_unit_options_bool

```

(End definition for `\l__siunitx_unit_options_bool`.)

`\siunitx_unit_options_apply:n` Options apply only if they have not already been set at this group level.

```

89 \cs_new_protected:Npn \siunitx_unit_options_apply:n #1
90 {
91   \bool_if:NF \l__siunitx_unit_options_bool
92   {
93     \tl_if_single_token:nT {#1}
94     {
95       \tl_if_exist:cT { l__siunitx_unit_options_ \token_to_str:N #1 _tl }
96       {

```

```

97         \keys_set:nv { siunitx }
98         { l__siunitx_unit_options_ \token_to_str:N #1 _tl }
99     }
100 }
101 }
102 \bool_set_true:N \l__siunitx_unit_options_bool
103 }

```

(End definition for `\siunitx_unit_options_apply:n`. This function is documented on page 141.)

6.4 Non-standard symbolic units

A few of the symbolic units require non-standard definitions: these are created here. They all use parts of the more general code but have particular requirements which can only be addressed by hand. Some of these could in principle be used in place of the dedicated definitions above, but at point of use that would then require additional expansions for each unit parsed: as the macro names would still be needed, this does not offer any real benefits.

\per The `\per` symbolic unit is a bit special: it has a mechanism entirely different from everything else, so has to be set up by hand. In literal mode it is represented by a very simple symbol!

```

104 \__siunitx_unit_set_symbolic:Nnn \per
105 { / }
106 { \__siunitx_unit_parse_per: }

```

(End definition for `\per`. This function is documented on page 144.)

\cancel The two special cases, `\cancel` and `\highlight`, are easy to deal with when parsing.
\highlight When not parsing, a precaution is taken to ensure that the user level equivalents always get a braced argument.

```

107 \__siunitx_unit_set_symbolic:Npnn \cancel
108 { }
109 { \__siunitx_unit_parse_special:n { \cancel } }
110 \__siunitx_unit_set_symbolic:Npnn \highlight #1
111 { \__siunitx_unit_literal_special:nN { \textcolor {#1} } }
112 { \__siunitx_unit_parse_special:n { \textcolor {#1} } }

```

(End definition for `\cancel` and `\highlight`. These functions are documented on page 144.)

\of The generic qualifier is simply the same as the dedicated ones except for needing to grab an argument.

```

113 \__siunitx_unit_set_symbolic:Npnn \of #1
114 { \ ( #1 ) }
115 { \__siunitx_unit_parse_qualifier:nn { \of {#1} } {#1} }

```

(End definition for `\of`. This function is documented on page 144.)

\raiseto Generic versions of the pre-defined power macros. These require an argument and so
\tothe cannot be handled using the general approach. Other than that, the code here is very similar to that in `\siunitx_unit_power_set:NnN`.

```

116 \__siunitx_unit_set_symbolic:Npnn \raiseto #1
117 { \__siunitx_unit_literal_power:nn {#1} }
118 { \__siunitx_unit_parse_power:nnN { \raiseto {#1} } {#1} \c_true_bool }

```

```

119 \__siunitx_unit_set_symbolic:Npnn \tothe #1
120 { ~ {#1} }
121 { \__siunitx_unit_parse_power:nnN { \tothe {#1} } {#1} \c_false_bool }

```

(End definition for `\raiseto` and `\tothe`. These functions are documented on page 144.)

6.5 Main formatting routine

Unit input can take two forms, “literal” units (material to be typeset directly) or “symbolic” units (macro-based). Before any parsing or typesetting is carried out, a small amount of pre-parsing has to be carried out to decide which of these cases applies.

Options which apply to the main formatting routine, and so are not tied to either symbolic or literal input.

```

\l_siunitx_unit_font_tl
\l__siunitx_unit_product_tl
\l__siunitx_unit_mass_kilogram_bool

```

```

122 \keys_define:nn { siunitx }
123 {
124   extract-mass-in-kilograms .bool_set:N =
125     \l__siunitx_unit_mass_kilogram_bool ,
126   inter-unit-product .tl_set:N =
127     \l_siunitx_unit_product_tl ,
128   unit-font-command .tl_set:N =
129     \l_siunitx_unit_font_tl
130 }

```

(End definition for `\l_siunitx_unit_font_tl`, `\l__siunitx_unit_product_tl`, and `\l__siunitx_unit_mass_kilogram_bool`. This variable is documented on page 140.)

```
\l_siunitx_unit_formatted_tl
```

A token list for the final formatted result: may or may not be generated by the parser, depending on the nature of the input.

```
131 \tl_new:N \l_siunitx_unit_formatted_tl
```

(End definition for `\l_siunitx_unit_formatted_tl`.)

```

\siunitx_unit_format:nN
\siunitx_unit_format_extract_prefixes:nNN
\siunitx_unit_format_combine_exponent:nnN
\siunitx_unit_format_multiply:nnN
\siunitx_unit_format_multiply_extract_prefixes:nnNN
\siunitx_unit_format_multiply_combine_exponent:nnnN
\__siunitx_unit_format:nNN
\__siunitx_unit_format_aux:

```

Formatting parsed units can take place either with the prefixes printed or separated out into a power of ten. This variation is handled using two separate functions: as this submodule does not really deal with numbers, formatting the numeral part here would be tricky and it is better therefore to have a mechanism to return a simple numerical power. At the same time, most uses will not want this more complex return format and so a version of the code which does not do this is also provided.

The main unit formatting routine groups all of the parsing/formatting, so that the only value altered will be the return token list. As definitions for the various unit macros are not globally created, the first step is to map over the list of names and active the unit definitions: these do different things depending on the switches set. There is then a decision to be made: is the unit input one that can be parsed (“symbolic”), or is it one containing one or more literals. In the latter case, there is still the need to convert the input into an expanded token list as some parts of the input could still be using unit macros.

Notice that for `\siunitx_unit_format:nN` a second return value from the auxiliary has to be allowed for, but is simply discarded.

6.6 Formatting literal units

While in literal mode no parsing occurs, there is a need to provide a few auxiliary functions to handle one or two special cases.

`__siunitx_unit_literal_power:nn` For printing literal units which are given before the unit they apply to, there is a slight rearrangement. This is ex[EXP]pandable to cover the case of creation of a PDF string.

```

209 \cs_new:Npn \__siunitx_unit_literal_power:nn #1#2 { #2 ~ {#1} }

```

(End definition for `__siunitx_unit_literal_power:nn`.)

`__siunitx_unit_literal_special:nN` When dealing with the special cases, there is an argument to absorb. This should be braced to be passed up to the user level, which is dealt with here.

```

210 \cs_new:Npn \__siunitx_unit_literal_special:nN #1#2 { #1 {#2} }

```

(End definition for `__siunitx_unit_literal_special:nN`.)

`__siunitx_unit_format_literal:n` To format literal units, there are two tasks to do. The input is x-type expanded to force any symbolic units to be converted into their literal representation: this requires setting the appropriate switch. In the resulting token list, all `.` and `~` tokens are then replaced by the current unit product token list. To enable this to happen correctly with a normal (active) `~`, a small amount of “protection” is needed first. To cover active sub- and superscript tokens, appropriate definitions are provided at this stage. Those have to be expandable macros rather than implicit character tokens.

As with other code dealing with user input, `\protected@edef` is used here rather than `\tl_set:Nx` as L^AT_EX 2_ε robust commands may be present.

```

211 \group_begin:
212   \char_set_catcode_active:n { '~ }
213   \cs_new_protected:Npx \__siunitx_unit_format_literal:n #1
214   {
215     \group_begin:

```

```

```

```

265 \__siunitx_unit_format_literal_auxiii:w
266 }
267 \cs_new_protected:Npn \__siunitx_unit_format_literal_auxiv:n #1
268 {
269 \__siunitx_unit_format_literal_auxv:nw { }
270 #1 \q_recursion_tail \q_recursion_stop
271 }

```

To deal properly with literal formatting, we have to worry about super- and subscript markers. That can be complicated as they could come anywhere in the input: we handle that by iterating through the input and picking them out. This avoids any issue with losing braces for mid-input scripts. We also have to deal with fractions, hence needing a series of nested loops and a change of separator.

```

351   { \cs_set_eq:Nc ##1 { \__siunitx_unit_ \token_to_str:N ##1 :w } }
352 }

```

(End definition for \siunitx_unit_pdfstring_context:. This function is documented on page [141](#).)

6.8 Parsing symbolic units

Parsing units takes place by storing information about each unit in a `prop`. As well as the unit itself, there are various other optional data points, for example a prefix or a power.

Some of these can come before the unit, others only after. The parser therefore tracks the number of units read and uses the current position to allocate data to individual units.

The result of parsing is a property list (`\l__siunitx_unit_parsed_prop`) which contains one or more entries for each unit:

- **prefix-*n*** The symbol for the prefix which applies to this unit, *e.g.* for `\kilo` with (almost certainly) would be `k`.
- **unit-*n*** The symbol for the unit itself, *e.g.* for `\metre` with (almost certainly) would be `m`.
- **power-*n*** The power which a unit is raised to. During initial parsing this will (almost certainly) be positive, but is combined with **per-*n*** to give a “fully qualified” power before any formatting takes place
- **per-*n*** Indicates that **per** applies to the current unit: stored during initial parsing then combined with **power-*n*** (and removed from the list) before further work.
- **qualifier-*n*** Any qualifier which applies to the current unit.
- **special-*n*** Any “special effect” to apply to the current unit.
- **command-*l*** The command corresponding to **unit-*n***: needed to track base units; used for `\gram` only.

`\l__siunitx_unit_sticky_per_bool`

There is one option when *parsing* the input (as opposed to *formatting* for output): how to deal with `\per`.

```

353 \keys_define:nn { siunitx }
354   {
355     sticky-per .bool_set:N = \l__siunitx_unit_sticky_per_bool
356   }

```

(End definition for `\l__siunitx_unit_sticky_per_bool`.)

`\l__siunitx_unit_parsed_prop`
`\l__siunitx_unit_per_bool`
`\l__siunitx_unit_position_int`

Parsing units requires a small number of variables are available: a **prop** for the parsed units themselves, a **bool** to indicate if `\per` is active and an **int** to track how many units have be parsed.

```

357 \prop_new:N \l__siunitx_unit_parsed_prop
358 \bool_new:N \l__siunitx_unit_per_bool
359 \int_new:N \l__siunitx_unit_position_int

```

(End definition for `\l__siunitx_unit_parsed_prop`, `\l__siunitx_unit_per_bool`, and `\l__siunitx_unit_position_int`.)

`__siunitx_unit_parse:n`

The main parsing function is quite simple. After initialising the variables, each symbolic unit is set up. The input is then simply inserted into the input stream: the symbolic units themselves then do the real work of placing data into the parsing system. There is then a bit of tidying up to ensure that later stages can rely on the nature of the data here.

```

360 \cs_new_protected:Npn \__siunitx_unit_parse:n #1
361   {
362     \prop_clear:N \l__siunitx_unit_parsed_prop

\l__siunitx_unit_parse_power:nnN
\l__siunitx_unit_parse_qualifier:nn
\l__siunitx_unit_parse_special:n

Storage of the various optional items follows broadly the same pattern in each case. The data to be stored is passed along with an appropriate key name to the underlying storage system. The details for each type of item should be relatively clear. For example, prefixes have to come before their “parent” unit and so there is some adjustment to do to add them to the correct unit.

```

435 }

```

(End definition for __siunitx_unit_parse_prefix:Nn and others.)

__siunitx_unit_parse_unit:Nn Parsing units is slightly more involved than the other cases: this is the one place where the tracking value is incremented. If the switch \l__siunitx_unit_per_bool is set true then the current unit is also reciprocal: this can only happen if \l__siunitx_unit_sticky_per_bool is also true, so only one test is required.

```

436 \cs_new_protected:Npn \__siunitx_unit_parse_unit:Nn #1#2
437 {
438     \int_incr:N \l__siunitx_unit_position_int
439     \tl_if_eq:nnT {#1} { \gram }
440     {
441         \__siunitx_unit_parse_add:nnnn { command }
442         { \int_use:N \l__siunitx_unit_position_int }
443         {#1} {#1}
444     }
445     \__siunitx_unit_parse_add:nnnn { unit }
446     { \int_use:N \l__siunitx_unit_position_int }
447     {#1} {#2}
448     \bool_if:NT \l__siunitx_unit_per_bool
449     {
450         \__siunitx_unit_parse_add:nnnn { per }

```

```

451         { \int_use:N \l__siunitx_unit_position_int }
452         { \per } { true }
453     }
454 }

```

(End definition for _siunitx_unit_parse_unit:Nn.)

_siunitx_unit_parse_per: Storing the \per command requires adding a data item separate from the power which applies: this makes later formatting much more straight-forward. This data could in principle be combined with the power, but depending on the output format required that may make life more complex. Thus this information is stored separately for later retrieval. If \per is set to be “sticky” then after parsing the first occurrence, any further uses are in error.

```

455 \cs_new_protected:Npn \_siunitx_unit_parse_per:
456 {
457     \bool_if:NTF \l__siunitx_unit_sticky_per_bool
458     {
459         \bool_set_true:N \l__siunitx_unit_per_bool
460         \cs_set_protected:Npn \per
461         { \msg_error:nn { siunitx } { unit / duplicate-sticky-per } }
462     }
463     {
464         \_siunitx_unit_parse_add:nnnn
465         { per } { \int_eval:n { \l__siunitx_unit_position_int + 1 } }
466         { \per } { true }
467     }
468 }

```

(End definition for _siunitx_unit_parse_per:.)

_siunitx_unit_parse_finalise:n If \per applies to the current unit, the power needs to be multiplied by -1 . That is done using an fp operation so that non-integer powers are supported. The flag for \per is also removed as this means we don’t have to check that the original power was positive. To be on the safe side, there is a check for a trivial power at this stage.

```

```

(End definition for \l_siunitx_unit_fraction_tl and others. This variable is documented on page 141.)

\l_siunitx_unit_bracket_bool A flag to indicate that the unit currently under construction will require brackets if a power is added.

```
571 \bool_new:N \l__siunitx_unit_bracket_bool
```

(End definition for \l_siunitx_unit_bracket_bool.)

\l_siunitx_unit_bracket_open_tl Abstracted out but currently purely internal.

```

572 \tl_new:N \l__siunitx_unit_bracket_open_tl
573 \tl_new:N \l__siunitx_unit_bracket_close_tl
574 \tl_set:Nn \l__siunitx_unit_bracket_open_tl { ( }
575 \tl_set:Nn \l__siunitx_unit_bracket_close_tl { ) }

```

(End definition for `\l__siunitx_unit_bracket_open_tl` and `\l__siunitx_unit_bracket_close_tl`.)

`\l__siunitx_unit_font_bool` A flag to control when font wrapping is applied to the output.

576 `\bool_new:N \l__siunitx_unit_font_bool`

(End definition for `\l__siunitx_unit_font_bool`.)

`\l__siunitx_unit_autofrac_bool` Dealing with the various ways that reciprocal (`\per`) can be handled requires a few different switches.

`\l__siunitx_unit_powers_positive_bool`

`\l__siunitx_unit_per_symbol_bool`

`\l__siunitx_unit_two_part_bool`

577 `\bool_new:N \l__siunitx_unit_autofrac_bool`

578 `\bool_new:N \l__siunitx_unit_per_symbol_bool`

579 `\bool_new:N \l__siunitx_unit_powers_positive_bool`

580 `\bool_new:N \l__siunitx_unit_two_part_bool`

(End definition for `\l__siunitx_unit_autofrac_bool` and others.)

`\l__siunitx_unit_numerator_bool` Indicates that the current unit should go into the numerator when splitting into two parts (fractions or other “sorted” styles).

581 `\bool_new:N \l__siunitx_unit_numerator_bool`

(End definition for `\l__siunitx_unit_numerator_bool`.)

`\l__siunitx_unit_qualifier_mode_tl` For storing the text of options which are best handled by picking function names.

582 `\tl_new:N \l__siunitx_unit_qualifier_mode_tl`

(End definition for `\l__siunitx_unit_qualifier_mode_tl`.)

`\l__siunitx_unit_combine_exp_fp` For combining an exponent with the first unit.

583 `\fp_new:N \l__siunitx_unit_combine_exp_fp`

(End definition for `\l__siunitx_unit_combine_exp_fp`.)

`\l__siunitx_unit_prefix_exp_bool` Used to determine if prefixes are converted into powers. Note that while this may be set as an option “higher up”, at this point it is handled as an internal switch (see the two formatting interfaces for reasons).

584 `\bool_new:N \l__siunitx_unit_prefix_exp_bool`

(End definition for `\l__siunitx_unit_prefix_exp_bool`.)

`\l__siunitx_unit_prefix_fp` When converting prefixes to powers, the calculations are done as an `fp`.

585 `\fp_new:N \l__siunitx_unit_prefix_fp`

(End definition for `\l__siunitx_unit_prefix_fp`.)

`\l__siunitx_unit_multiple_fp` For multiplying units.

586 `\fp_new:N \l__siunitx_unit_multiple_fp`

(End definition for `\l__siunitx_unit_multiple_fp`.)

`\l__siunitx_unit_current_tl` Building up the (partial) formatted unit requires some token list storage. Each part of the unit combination that is recovered also has to be placed in a token list: this is a dedicated one to leave the scratch variables available.

`\l__siunitx_unit_part_tl`

587 `\tl_new:N \l__siunitx_unit_current_tl`

588 `\tl_new:N \l__siunitx_unit_part_tl`

(End definition for `\l__siunitx_unit_current_tl` and `\l__siunitx_unit_part_tl`.)

`\l_siunitx_unit_denominator_tl` For fraction-like units, space is needed for the denominator as well as the numerator (which is handled using `\l__siunitx_unit_formatted_tl`).

```

589 \tl_new:N \l__siunitx_unit_denominator_tl

(End definition for \l_siunitx_unit_denominator_tl.)

```

`\l__siunitx_unit_total_int` The formatting routine needs to know both the total number of units and the current unit. Thus an `int` is required in addition to `\l__siunitx_unit_position_int`.

```

590 \int_new:N \l__siunitx_unit_total_int

(End definition for \l__siunitx_unit_total_int.)

```

`_siunitx_unit_format_parsed:`
`_siunitx_unit_format_parsed_aux:n` The main formatting routine is essentially a loop over each position, reading the various parts of the unit to build up complete unit combination.

```

706     \exp_not:V \l__siunitx_unit_bracket_close_tl
707   }
708   { \exp_not:V #1 }
709 }

```

(End definition for _siunitx_unit_format_bracket:N.)

_siunitx_unit_format_power: Formatting powers requires a test for negative numbers and depending on output format requests some adjustment to the stored value. This could be done using an fp function, but that would be slow compared to a dedicated if lower-level approach based on delimited arguments.

```

710 \cs_new_protected:Npn \_siunitx_unit_format_power:
711 {

```

```

712 \__siunitx_unit_format_font:
713 \exp_after:wN \__siunitx_unit_format_power_aux:wTF
714 \l__siunitx_unit_part_tl - \q_stop
715 { \__siunitx_unit_format_power_negative: }
716 { \__siunitx_unit_format_power_positive: }
717 }
718 \cs_new:Npn \__siunitx_unit_format_power_aux:wTF #1 - #2 \q_stop
719 { \tl_if_empty:nTF {#1} }

```

In the case of positive powers, there is little to do: add the power as a subscript (must be required as the parser ensures it's $\neq 1$).

```

720 \cs_new_protected:Npn \__siunitx_unit_format_power_positive:
721 { \__siunitx_unit_format_power_superscript: }

```

Dealing with negative powers starts by flipping the switch used to track where in the final output the current part should get added to. For the case where the output is fraction-like, strip off the \sim then ensure that the result is not the trivial power 1. Assuming all is well, addition to the current unit combination goes ahead.

```

722 \cs_new_protected:Npn \__siunitx_unit_format_power_negative:
723 {
724   \bool_set_false:N \l__siunitx_unit_numerator_bool
725   \bool_if:NTF \l__siunitx_unit_powers_positive_bool
726   {
727     \tl_set:Nx \l__siunitx_unit_part_tl
728     {
729       \exp_after:wN \__siunitx_unit_format_power_negative_aux:w
730       \l__siunitx_unit_part_tl \q_stop
731     }
732     \str_if_eq:VnF \l__siunitx_unit_part_tl { 1 }
733     { \__siunitx_unit_format_power_superscript: }
734   }
735   { \__siunitx_unit_format_power_superscript: }
736 }
737 \cs_new:Npn \__siunitx_unit_format_power_negative_aux:w - #1 \q_stop
738 { \exp_not:n {#1} }

```

Adding the power as a superscript has the slight complication that there is the possibility of needing some brackets. The superscript itself uses `\sp` as that avoids any category code issues and also allows redirection at a higher level more readily.

890     \__siunitx_unit_format_output_aux:nV { formatted }
891     \l__siunitx_unit_product_tl
892   }

```

There are a few things to worry about at this stage if the current part is in the denominator. Powers have already been dealt with and some formatting outcomes only need a branch at the final point of building the entire unit. That means that there are three possible outcomes here: if collecting two separate parts, add to the denominator with a product separator, or if only building one token list there may be a need to use a symbol separator. When the `repeated-symbol` option is in use there may be a need to add a leading 1 to the output in the case where the first unit is in the denominator: that can be picked up by looking for empty output in combination with the flag for using a symbol in the output but not a two-part strategy.

```

893   \cs_new_protected:Npn \__siunitx_unit_format_output_denominator:

940   }
941 }

```

(End definition for `_siunitx_unit_format_font:`)

`_siunitx_unit_format_finalise:` Finalising the unit format is really about picking up the cases involving fractions: these require assembly of the parts with the need to add additional material in some cases

```

\siunitx_unit_format_finalise_autofrac:
\siunitx_unit_format_finalise_fractional:
\siunitx_unit_format_finalise_power:
942 \cs_new_protected:Npn \_siunitx_unit_format_finalise:
943 {
944   \tl_if_empty:NF \l__siunitx_unit_denominator_tl
945   {
946     \bool_if:NTF \l__siunitx_unit_powers_positive_bool
947     { \_siunitx_unit_format_finalise_fractional: }
948     { \_siunitx_unit_format_finalise_power: }
949   }
950 }

```

For fraction-like output, there are three possible choices and two actual styles. In all cases, if the numerator is empty then it is set here to 1. To deal with the “auto-format” case, the two styles (fraction and symbol) are handled in auxiliaries: this allows both to be used at the same time! Beyond that, the key here is to use a single `\tl_set:Nx` to keep down the number of assignments.

```

951 \cs_new_protected:Npn \_siunitx_unit_format_finalise_fractional:
952 {
953   \tl_if_empty:NT \l__siunitx_unit_formatted_tl
954   { \tl_set:Nn \l__siunitx_unit_formatted_tl { 1 } }
955   \bool_if:NTF \l__siunitx_unit_autofrac_bool
956   { \_siunitx_unit_format_finalise_autofrac: }
957   {
958     \bool_if:NTF \l__siunitx_unit_per_symbol_bool
959     { \_siunitx_unit_format_finalise_symbol: }
960     { \_siunitx_unit_format_finalise_fraction: }
961   }
962 }

```

For the “auto-selected” fraction method, the two other auxiliary functions are used to do both forms of formatting. So that everything required is available, this needs one group so that the second auxiliary receives the correct input. After that it is just a case of applying `\mathchoice` to the formatted output.

```

963 \cs_new_protected:Npn \_siunitx_unit_format_finalise_autofrac:

```

```

964 {
965   \group_begin:
966     \__siunitx_unit_format_finalise_fraction:
967   \exp_args:NNNV \group_end:
968   \tl_set:Nn \l__siunitx_unit_tmp_tl \l__siunitx_unit_formatted_tl
969   \__siunitx_unit_format_finalise_symbol:
970   \tl_set:Nx \l__siunitx_unit_formatted_tl
971     {
972       \mathchoice
973         { \exp_not:V \l__siunitx_unit_tmp_tl }
974         { \exp_not:V \l__siunitx_unit_formatted_tl }
975         { \exp_not:V \l__siunitx_unit_formatted_tl }
976         { \exp_not:V \l__siunitx_unit_formatted_tl }
977     }
978 }

```

When using a fraction function the two parts are now assembled.

```

979 \cs_new_protected:Npn \__siunitx_unit_format_finalise_fraction:
980 {
981   \tl_set:Nx \l__siunitx_unit_formatted_tl
982     {
983       \exp_not:V \l_siunitx_unit_fraction_tl
984       { \exp_not:V \l__siunitx_unit_formatted_tl }
985       { \exp_not:V \l__siunitx_unit_denominator_tl }
986     }
987 }
988 \cs_new_protected:Npn \__siunitx_unit_format_finalise_symbol:
989 {
990   \tl_set:Nx \l__siunitx_unit_formatted_tl
991     {
992       \exp_not:V \l__siunitx_unit_formatted_tl
993       \exp_not:V \l__siunitx_unit_per_symbol_tl
994       \__siunitx_unit_format_bracket:N \l__siunitx_unit_denominator_tl
995     }
996 }

```

In the case of sorted powers, there is a test to make sure there was at least one positive power, and if so a simple join of the two parts with the appropriate product.

```

997 \cs_new_protected:Npn \__siunitx_unit_format_finalise_power:
998 {
999   \tl_if_empty:NTF \l__siunitx_unit_formatted_tl
1000     {
1001       \tl_set_eq:NN
1002         \l__siunitx_unit_formatted_tl
1003         \l__siunitx_unit_denominator_tl
1004     }
1005     {
1006       \tl_set:Nx \l__siunitx_unit_formatted_tl
1007         {
1008           \exp_not:V \l__siunitx_unit_formatted_tl
1009           \exp_not:V \l__siunitx_unit_product_tl
1010           \exp_not:V \l__siunitx_unit_denominator_tl
1011         }
1012     }
1013 }

```

(End definition for `_siunitx_unit_format_finalise:` and others.)

6.10 Non-Latin character support

`_siunitx_unit_non_latin:n` A small amount of code to make it convenient to include non-Latin characters in units without having to directly include them in the sources directly. We only make the first token active as some packages (e.g. kotex) do this.

```

1014 \bool_lazy_or:nnTF
1015   { \sys_if_engine luatex_p: }
1016   { \sys_if_engine xetex_p: }
1017   {
1018     \cs_new:Npn \_siunitx_unit_non_latin:n #1
1019       { \char_generate:nn {#1} { \char_value_catcode:n {#1} } }
1020   }
1021   {
1022     \cs_new:Npn \_siunitx_unit_non_latin:n #1
1023       {
1024         \exp_last_unbraced:Nf \_siunitx_unit_non_latin:nnnn
1025         { \char_to_utfviii_bytes:n {#1} }
1026       }
1027     \cs_new:Npn \_siunitx_unit_non_latin:nnnn #1#2#3#4
1028       {
1029         \exp_after:wN \exp_after:wN \exp_after:wN
1030         \exp_not:N \char_generate:nn {#1} { 13 }
1031         \char_generate:nn {#2} { 12 }
1032       }
1033   }

```

(End definition for `_siunitx_unit_non_latin:n` and `_siunitx_unit_non_latin:nnnn`.)

6.11 Pre-defined unit components

Quite a number of units can be predefined: while this is a code-level module, there is little point having a unit parser which does not start off able to parse any units!

\kilogram The basic SI units: technically the correct spelling is `\metre` but US users tend to use `\meter`.

\metre `\meter`

\meter `\siunitx_declare_unit:Nn \kilogram { \kilo \gram }`

\mole `\siunitx_declare_unit:Nn \metre { m }`

\kelvin `\siunitx_declare_unit:Nn \meter { \metre }`

\candela `\siunitx_declare_unit:Nn \mole { mol }`

\second `\siunitx_declare_unit:Nn \second { s }`

\ampere `\siunitx_declare_unit:Nn \ampere { A }`

`\siunitx_declare_unit:Nn \kelvin { K }`

`\siunitx_declare_unit:Nn \candela { cd }`

(End definition for `\kilogram` and others. These functions are documented on page 142.)

\gram The gram is an odd unit as it is needed for the base unit kilogram.

```

1042 \siunitx_declare_unit:Nn \gram { g }

```

(End definition for `\gram`. This function is documented on page 142.)

`\yocto` The various SI multiple prefixes are defined here: first the small ones.

```

1043 \siunitx_declare_prefix:Nnn \yocto { -24 } { y }
1044 \siunitx_declare_prefix:Nnn \zepto { -21 } { z }
1045 \siunitx_declare_prefix:Nnn \atto { -18 } { a }
1046 \siunitx_declare_prefix:Nnn \femto { -15 } { f }
1047 \siunitx_declare_prefix:Nnn \pico { -12 } { p }
1048 \siunitx_declare_prefix:Nnn \nano { -9 } { n }
1049 \siunitx_declare_prefix:Nnn \micro { -6 } { \_siunitx_unit_non_latin:n { "03BC } }
1050 \siunitx_declare_prefix:Nnn \milli { -3 } { m }
1051 \siunitx_declare_prefix:Nnn \centi { -2 } { c }
1052 \siunitx_declare_prefix:Nnn \deci { -1 } { d }

```

(End definition for `\yocto` and others. These functions are documented on page 142.)

`\deca` Now the large ones.

```

1053 \siunitx_declare_prefix:Nnn \deca { 1 } { da }
1054 \siunitx_declare_prefix:Nnn \hecto { 1 } { da }
1055 \siunitx_declare_prefix:Nnn \kilo { 2 } { h }
1056 \siunitx_declare_prefix:Nnn \mega { 3 } { k }
1057 \siunitx_declare_prefix:Nnn \giga { 6 } { M }
1058 \siunitx_declare_prefix:Nnn \tera { 9 } { G }
1059 \siunitx_declare_prefix:Nnn \peta { 12 } { T }
1060 \siunitx_declare_prefix:Nnn \peta { 15 } { P }
1061 \siunitx_declare_prefix:Nnn \exa { 18 } { E }
1062 \siunitx_declare_prefix:Nnn \zetta { 21 } { Z }
1063 \siunitx_declare_prefix:Nnn \yotta { 24 } { Y }

```

(End definition for `\deca` and others. These functions are documented on page 142.)

`\becquerel` Named derived units: first half of alphabet.

```

1064 \siunitx_declare_unit:Nn \becquerel { Bq }
1065 \siunitx_declare_unit:Nx \degreeCelsius { \_siunitx_unit_non_latin:n { "00B0 } C }
1066 \siunitx_declare_unit:Nn \coulomb { C }
1067 \siunitx_declare_unit:Nn \farad { F }
1068 \siunitx_declare_unit:Nn \gray { Gy }
1069 \siunitx_declare_unit:Nn \hertz { Hz }
1070 \siunitx_declare_unit:Nn \henry { H }
1071 \siunitx_declare_unit:Nn \joule { J }
1072 \siunitx_declare_unit:Nn \katal { kat }
1073 \siunitx_declare_unit:Nn \lumen { lm }
1074 \siunitx_declare_unit:Nn \lux { lx }

```

(End definition for `\becquerel` and others. These functions are documented on page 143.)

`\newton` Named derived units: second half of alphabet.

```

1075 \siunitx_declare_unit:Nn \newton { N }
1076 \siunitx_declare_unit:Nx \ohm { \_siunitx_unit_non_latin:n { "03A9 } }
1077 \siunitx_declare_unit:Nn \pascal { Pa }
1078 \siunitx_declare_unit:Nn \radian { rad }
1079 \siunitx_declare_unit:Nn \siemens { S }
1080 \siunitx_declare_unit:Nn \sievert { Sv }
1081 \siunitx_declare_unit:Nn \steradian { sr }
1082 \siunitx_declare_unit:Nn \tesla { T }
1083 \siunitx_declare_unit:Nn \volt { V }
1084 \siunitx_declare_unit:Nn \watt { W }
1085 \siunitx_declare_unit:Nn \weber { Wb }

```

(End definition for `\newton` and others. These functions are documented on page 143.)

`\astronomicalunit` Non-SI, but accepted for general use. Once again there are two spellings, here for litre and with different output in this case.

```

1086 \siunitx_declare_unit:Nn \astronomicalunit { au }
1087 \siunitx_declare_unit:Nn \bel { B }
1088 \siunitx_declare_unit:Nn \decibel { \deci \bel }
1089 \siunitx_declare_unit:Nn \dalton { Da }
1090 \siunitx_declare_unit:Nn \day { d }
1091 \siunitx_declare_unit:Nn \electronvolt { eV }
1092 \siunitx_declare_unit:Nn \hectare { ha }
1093 \siunitx_declare_unit:Nn \hour { h }
1094 \siunitx_declare_unit:Nn \litre { L }
1095 \siunitx_declare_unit:Nn \liter { \litre }
1096 \siunitx_declare_unit:Nn \minute { min }
1097 \siunitx_declare_unit:Nn \neper { Np }
1098 \siunitx_declare_unit:Nn \tonne { t }

```

(End definition for `\astronomicalunit` and others. These functions are documented on page 143.)

`\arcminute` Arc units: again, non-SI, but accepted for general use.

```

1099 \siunitx_declare_unit:Nx \arcminute { \_siunitx_unit_non_latin:n { "02B9 } }
1100 \siunitx_declare_unit:Nx \arcsecond { \_siunitx_unit_non_latin:n { "02BA } }
1101 \siunitx_declare_unit:Nx \degree { \_siunitx_unit_non_latin:n { "00B0 } }

```

(End definition for `\arcminute`, `\arcsecond`, and `\degree`. These functions are documented on page 143.)

`\percent` For percent, the raw character is the most flexible way of handling output.

```

1102 \siunitx_declare_unit:Nx \percent { \cs_to_str:N \% }

```

(End definition for `\percent`. This function is documented on page 143.)

`\square` Basic powers.

```

1103 \siunitx_declare_power:NNn \square \squared { 2 }
1104 \siunitx_declare_power:NNn \cubic \cubed { 3 }

```

(End definition for `\square` and others. These functions are documented on page 143.)

6.13 Standard settings for module options

Some of these follow naturally from the point of definition (*e.g.* boolean variables are always false to begin with), but for clarity everything is set here.

```

1147 \keys_set:nn { siunitx }
1148 {
1149   bracket-unit-denominator = true      ,
1150   forbid-literal-units     = false     ,
1151   fraction-command         = \frac     ,
1152   inter-unit-product       = \,        ,
1153   extract-mass-in-kilograms = true      ,
1154   parse-units              = true      ,
1155   per-mode                 = power     ,
1156   per-symbol               = /         ,
1157   qualifier-mode           = subscript ,
1158   qualifier-phrase         =           ,
1159   sticky-per               = false     ,
1160   unit-font-command        = \mathrm
1161 }
1162 \</package>

```

Part XI

siunitx-abbreviations – Abbreviations

`\A` Abbreviations for currents.
`\pA`
`\nA`
`\uA`
`\mA`
`\kA`

`\fg` Abbreviations for masses.
`\pg`
`\ng`
`\ug`
`\mg`
`\g`
`\kg`

`\K` Abbreviations for temperature.

`\m` Abbreviations for lengths.
`\pm`
`\nm`
`\um`
`\mm`
`\cm`
`\dm`
`\km`

`\s` Abbreviations for times.
`\as`
`\fs`
`\ps`
`\ns`
`\us`
`\ms`

`\Hz` Abbreviations for frequencies.
`\mHz`
`\kHz`
`\MHz`
`\GHz`
`\THz`

`\GPa`

`\mohm` Abbreviations for resistance.
`\kohm`
`\Mohm`

`\F` Abbreviations for capacitance.
`\fF`
`\pF`
`\nF`
`\uF`

`\dB` Abbreviation for decibel.

`\kWh` Abbreviation for kilowatt-hours.

1 siunitx-abbreviation implementation

Start the DocStrip guards.

```
1 \langle *package \rangle
```

The abbreviation file contains a number of short (mainly two or three letter) versions of the usual long names. They are divided up into related groups, mainly to avoid an overly long list in one place.

```
\A Currents.
\pA 2 \siunitx_declare_unit:Nn \A { \ampere }
\nA 3 \siunitx_declare_unit:Nn \pA { \pico \ampere }
\uA 4 \siunitx_declare_unit:Nn \nA { \nano \ampere }
\mA 5 \siunitx_declare_unit:Nn \uA { \micro \ampere }
\kA 6 \siunitx_declare_unit:Nn \mA { \milli \ampere }
7 \siunitx_declare_unit:Nn \kA { \kilo \ampere }
```

(End definition for \A and others. These functions are documented on page 179.)

```
\Hz Then frequencies.
\mHz 8 \siunitx_declare_unit:Nn \Hz { \hertz }
\kHz 9 \siunitx_declare_unit:Nn \mHz { \milli \hertz }
\MHz 10 \siunitx_declare_unit:Nn \kHz { \kilo \hertz }
\GHz 11 \siunitx_declare_unit:Nn \MHz { \mega \hertz }
\THz 12 \siunitx_declare_unit:Nn \GHz { \giga \hertz }
13 \siunitx_declare_unit:Nn \THz { \tera \hertz }
```

(End definition for \Hz and others. These functions are documented on page 179.)

\mol Amounts of substance (moles).
\fmol 14 \siunitx_declare_unit:Nn \mol { \mole }
\pmol 15 \siunitx_declare_unit:Nn \fmol { \femto \mole }
\nmol 16 \siunitx_declare_unit:Nn \pmol { \pico \mole }
\umol 17 \siunitx_declare_unit:Nn \nmol { \nano \mole }
\mmol 18 \siunitx_declare_unit:Nn \umol { \micro \mole }
\kmol 19 \siunitx_declare_unit:Nn \mmol { \milli \mole }
20 \siunitx_declare_unit:Nn \kmol { \kilo \mole }

(End definition for \mol and others. These functions are documented on page 180.)

\V Potentials.
\pV 21 \siunitx_declare_unit:Nn \V { \volt }
\nV 22 \siunitx_declare_unit:Nn \pV { \pico \volt }
\uV 23 \siunitx_declare_unit:Nn \nV { \nano \volt }
\mV 24 \siunitx_declare_unit:Nn \uV { \micro \volt }
\kV 25 \siunitx_declare_unit:Nn \mV { \milli \volt }
26 \siunitx_declare_unit:Nn \kV { \kilo \volt }

(End definition for \V and others. These functions are documented on page 180.)

\hl Volumes.
\l 27 \siunitx_declare_unit:Nn \hl { \hecto \litre }
\ml 28 \siunitx_declare_unit:Nn \l { \litre }
\ul 29 \siunitx_declare_unit:Nn \ml { \milli \litre }
\hL 30 \siunitx_declare_unit:Nn \ul { \micro \litre }
\L 31 \siunitx_declare_unit:Nn \hL { \hecto \liter }
\mL 32 \siunitx_declare_unit:Nn \L { \liter }
\uL 33 \siunitx_declare_unit:Nn \mL { \milli \liter }
34 \siunitx_declare_unit:Nn \uL { \micro \liter }

(End definition for \hl and others. These functions are documented on page 180.)

\fg Masses.
\pg 35 \siunitx_declare_unit:Nn \fg { \femto \gram }
\ng 36 \siunitx_declare_unit:Nn \pg { \pico \gram }
\ug 37 \siunitx_declare_unit:Nn \ng { \nano \gram }
\mg 38 \siunitx_declare_unit:Nn \ug { \micro \gram }
\g 39 \siunitx_declare_unit:Nn \mg { \milli \gram }
\kg 40 \siunitx_declare_unit:Nn \g { \gram }
41 \siunitx_declare_unit:Nn \kg { \kilo \gram }

(End definition for \fg and others. These functions are documented on page 179.)

\W Energies and powers
\uW 42 \siunitx_declare_unit:Nn \W { \watt }
\mW 43 \siunitx_declare_unit:Nn \uW { \micro \watt }
\kW 44 \siunitx_declare_unit:Nn \mW { \milli \watt }
\MW 45 \siunitx_declare_unit:Nn \kW { \kilo \watt }
\GW 46 \siunitx_declare_unit:Nn \MW { \mega \watt }
\kJ 47 \siunitx_declare_unit:Nn \GW { \giga \watt }
\J 48 \siunitx_declare_unit:Nn \J { \joule }

```

Part XII

siunitx-binary – Binary units

This submodule provides binary units and prefixes. These are not formally part of the SI but are recommended by BIPM as units of information.

| | |
|--------------------|---|
| <code>\kibi</code> | Prefixes, all of which are integer powers of 2: the powers are <i>not</i> stored or available for conversion. |
| <code>\mebi</code> | |
| <code>\gibi</code> | |
| <code>\tebi</code> | |
| <code>\pebi</code> | |
| <code>\exbi</code> | |
| <code>\zebi</code> | |
| <code>\yobi</code> | |

| | |
|--------------------|---------------------------|
| <code>\bit</code> | Units for bits and bytes. |
| <code>\byte</code> | |

1 siunitx-binary implementation

Start the DocStrip guards.

```
1 \langle*package\rangle
```

```
\kibi All very simple.
\mebi 2 \siunitx_declare_prefix:Nn \kibi { Ki }
\gibi 3 \siunitx_declare_prefix:Nn \mebi { Mi }
\tebi 4 \siunitx_declare_prefix:Nn \gibi { Gi }
\pebi 5 \siunitx_declare_prefix:Nn \tebi { Ti }
\exbi 6 \siunitx_declare_prefix:Nn \pebi { Pi }
\zebi 7 \siunitx_declare_prefix:Nn \exbi { Ei }
\yobi 8 \siunitx_declare_prefix:Nn \zebi { Zi }
      9 \siunitx_declare_prefix:Nn \yobi { Yi }
```

(End definition for `\kibi` and others. These functions are documented on page 185.)

```
\bit
\byte 10 \siunitx_declare_unit:Nn \bit { bit }
      11 \siunitx_declare_unit:Nn \byte { B }
```

(End definition for `\bit` and `\byte`. These functions are documented on page 185.)

```
12 \ranglepackage\rangle
```

Part XIII

siunitx-command – Units as document command

This submodule provides support for creating free-standing document commands for unit macros.

1 Creating units as document commands

\siunitx_command_create:

\siunitx_command_create:

Maps over the list of know unit commands and creates the appropriate document command to support them, as controlled by the options below.

1.1 Key-value options

The options defined by this submodule are available within the l3keys `siunitx` tree.

These options are all preamble-only.

free-standing-units

free-standing-units = true|false

Switch to determine whether free standing document commands are created for symbolic units. This will include not only units themselves but also prefixes, *etc.* The standard setting is **false**.

overwrite-commands

overwrite-commands = true|false

Switch to determine whether when creating free standing document commands, any existing document commands are overwritten. The standard setting is **false**.

space-before-unit

space-before-unit = true|false

Switch to determine whether a space is inserted before free standing document commands. The standard setting is **false**.

unit-optional-argument

unit-optional-argument = true|false

Switch to determine whether free standing document commands take an optional argument (a number). The standard setting is **false**.

use-xspace

use-xspace = true|false

Switch to determine whether free standing document commands use the `xparse` package to insert space after the command names. The standard setting is **false**. When set **true**, the `xparse` package will be loaded at the start of the document if not already available.

2 siunitx-command implementation

Start the DocStrip guards.

```
1 <*package>
```

Identify the internal prefix (L^AT_EX3 DocStrip convention): only internal material in this *submodule* should be used directly.

```
2 <@@=siunitx_command>
```

```
\l__siunitx_command_tmp_tl
```

```
3 \tl_new:N \l__siunitx_command_tmp_tl
```

(End definition for `\l__siunitx_command_tmp_tl`.)

2.1 Options

```
\l__siunitx_command_create_bool
\l__siunitx_command_overwrite_bool
\l__siunitx_command_prespace_bool
\l__siunitx_command_optarg_bool
\l__siunitx_command_xspace_bool
```

```
4 \keys_define:nn { siunitx }
5 {
6   free-standing-units .bool_set:N =
7     \l__siunitx_command_create_bool ,
8   overwrite-commands .bool_set:N =
9     \l__siunitx_command_overwrite_bool ,
10  space-before-unit .bool_set:N =
11    \l__siunitx_command_prespace_bool ,
12  unit-optional-argument .bool_set:N =
13    \l__siunitx_command_optarg_bool ,
14  use-xspace .bool_set:N =
15    \l__siunitx_command_xspace_bool
16 }
```

(End definition for `\l__siunitx_command_create_bool` and others.)

These preamble-only options are all disabled at the start of the document.

```
17 \AtBeginDocument
18 {
19   \clist_map_inline:nn
20     {
21     free-standing-units ,
22     overwrite-commands ,
23     space-before-unit ,
24     unit-optional-argument ,
25     use-xspace
26   }
27   {
28     \keys_define:nn { siunitx }
29     {
30       #1 .code:n =
31       { \msg_warning:nnn { siunitx } { option-preamble-only } {#1} }
32     }
33   }
34 }
35 \msg_new:nnn { siunitx } { option-preamble-only }
36 { Option~'~#1'~only~available~in~the~preamble. }
```

2.2 Creation of unit document commands

`\siunitx_command_create:` Creating document commands is all done by a single function which is set up using expansion: that way the tests are only run once. Other than that, this is all just a question of picking up all the various routes.

```

37 \cs_new_protected:Npn \siunitx_command_create:
38 {
39   \bool_if:NT \l__siunitx_command_create_bool
40   { \__siunitx_command_create: }

```

At the beginning of table cells and inside x-type expansion, all symbolic units need to have *some* definition.

```

41   \seq_map_inline:Nn \l_siunitx_unit_symbolic_seq
42   {
43     \cs_if_free:NT ##1
44     { \cs_set_protected:Npn ##1 { \ERROR } }
45   }

```

Where the `soulpos` package is loaded *after* `siunitx`, the commands `\hl` and `\ul` will be created only after the hook is used. The `soul` package creates those using `\newcommand`, so we have to avoid an issue.

```

46   \@ifpackageloaded { soulpos }
47   {
48     \@ifpackageloaded { soul }
49     { }
50     {
51       \cs_undefine:N \hl
52       \cs_undefine:N \ul
53     }
54   }
55   { }
56 }
57 \AtBeginDocument { \siunitx_command_create: }
58 \cs_new_protected:Npn \__siunitx_command_create:
59 {
60   \bool_if:NT \l__siunitx_command_xspace_bool
61   { \RequirePackage { xspace } }
62   \bool_if:NT \l__siunitx_command_overwrite_bool
63   {
64     \seq_map_inline:Nn \l_siunitx_unit_symbolic_seq
65     { \cs_undefine:N ##1 }
66   }
67   \cs_set_protected:Npx \__siunitx_command_create:N ##1
68   {
69     \ProvideDocumentCommand ##1 { \bool_if:NT \l__siunitx_command_optarg_bool { o } }
70     {
71       \mode_leave_vertical:
72       \group_begin:
73       \bool_if:NTF \l__siunitx_command_optarg_bool
74       { \exp_not:N \IfNoValueTF {####1} }
75       { \use_i:nn }
76       {
77         \siunitx_unit_options_apply:n {##1}
78         \bool_if:NT \l__siunitx_command_prespace_bool { \exp_not:N \ }

```

```

79         \siunitx_unit_format:nN {##1}
80         \exp_not:N \l__siunitx_command_tmp_tl
81         \siunitx_print_unit:V
82         \exp_not:N \l__siunitx_command_tmp_tl
83     }
84     { \siunitx_quantity:nn {####1} {##1} }
85 \group_end:
86 \bool_if:NT \l__siunitx_command_xspace_bool { \exp_not:N \xspace }
87 }
88 }
89 \seq_map_function:NN \l_siunitx_unit_seq \__siunitx_command_create:N
90 }
91 \cs_new_protected:Npn \__siunitx_command_create:N #1 { }

```

(End definition for `\siunitx_command_create:`, `__siunitx_command_create:`, and `__siunitx_command_create:N`. This function is documented on page [186](#).)

2.3 Standard settings for module options

Some of these follow naturally from the point of definition (*e.g.* boolean variables are always `false` to begin with), but for clarity everything is set here.

```

92 \keys_set:nn { siunitx }
93 {
94     free-standing-units      = false ,
95     overwrite-commands      = false ,
96     space-before-unit       = false ,
97     unit-optional-argument  = false ,
98     use-xspace               = false
99 }
100 </package>

```

Part XIV

siunitx-emulation – Emulation

1 siunitx-emulation implementation

Identify the internal prefix (L^AT_EX3 DocStrip convention). In contrast to other parts of the bundle, the functions here may need to redefine those from various submodules.

```
1 <@@=siunitx>
   Start the DocStrip guards.
2 <*package>
3 <*options>
   Some messages.
4 \msg_new:nnn { siunitx } { option-deprecated }
5 {
6   Option~"#1"~has~been~deprecated~in~this~release.\\ \\
7   Use~"#2"~as~a~replacement.
8 }
9 \msg_new:nnn { siunitx } { option-removed }
10 { Option~"#1"~has~been~removed~in~this~release. }
```

```
\_siunitx_option_deprecated:nn
\_siunitx_option_deprecated:nnn
\_siunitx_option_deprecated:nnV
```

Abstract out a simple wrapper.

```
11 \cs_new_protected:Npn \_siunitx_option_deprecated:nn #1#2
12 {
13   \msg_info:nnnn { siunitx } { option-deprecated } {#1} {#2}
14   \keys_set:nn { siunitx } {#2}
15 }
16 \cs_new_protected:Npn \_siunitx_option_deprecated:nnn #1#2#3
17 {
18   \msg_info:nnnn { siunitx } { option-deprecated } {#1} {#2}
19   \keys_set:nn { siunitx } { #2 = #3 }
20 }
21 \cs_generate_variant:Nn \_siunitx_option_deprecated:nnn { nnV }
```

(End definition for _siunitx_option_deprecated:nn and _siunitx_option_deprecated:nnn.)

```
\_siunitx_option_removed:n
\_siunitx_option_removed:V
```

Abstract out a simple wrapper.

```
22 \cs_new_protected:Npn \_siunitx_option_removed:n #1
23 {
24   \msg_warning:nnx { siunitx } { option-removed }
25   {#1}
26 }
27 \cs_generate_variant:Nn \_siunitx_option_removed:n { V }
```

(End definition for _siunitx_option_removed:n.)

1.1 Load-time option

```
28 \clist_map_inline:nn
29 {

619     } ,
620     prefixes-as-symbols .default:n = true
621 }
622 </options>

```

1.10 Preamble commands

623 <*interfaces>

\DeclareBinaryPrefix We simply drop #3.

```

624 \NewDocumentCommand \DeclareBinaryPrefix { +m m m }
625 {
626     \siunitx_declare_prefix:Nn #1 {#2}
627 }

```

(End definition for \DeclareBinaryPrefix. This function is documented on page ??.)

\DeclareSIPrePower **\DeclareSIPostPower** Simply use a throw-away command for the part we do not need: this can be followed by some clean-up.

```

628 \NewDocumentCommand \DeclareSIPrePower { +m m m }
629 {
630     \siunitx_declare_power:NNn #1 \_siunitx_tmp:w {#2}
631     \seq_remove_all:Nn \l_siunitx_unit_symbolic_seq { \_siunitx_tmp:w }
632 }

```

```

633 \NewDocumentCommand \DeclareSIPostPower { +m m }
634 {
635   \siunitx_declare_power:NNn \_siunitx_tmp:w #1 {#2}
636   \seq_remove_all:Nn \l_siunitx_unit_symbolic_seq { \_siunitx_tmp:w }
637 }

```

(End definition for \DeclareSIPrePower and \DeclareSIPostPower. These functions are documented on page ??.)

1.11 Document commands

\si A straight copy of \unit.

```

638 \NewDocumentCommand \si { O { } m }
639 {
640   \mode_leave_vertical:
641   \group_begin:
642     \keys_set:nn { siunitx } {#1}
643     \siunitx_unit_format:nN {#2} \l__siunitx_tmp_tl
644     \siunitx_print_unit:V \l__siunitx_tmp_tl
645   \group_end:
646 }

```

(End definition for \si. This function is documented on page ??.)

\SI Almost the same as \qty, but with the addition pre-unit.

```

647 \NewDocumentCommand \SI { O { } m o m }
648 {
649   \mode_leave_vertical:
650   \group_begin:
651     \keys_set:nn { siunitx } {#1}
652     \IfNoValueF {#3}
653     {
654       \siunitx_unit_format:nN {#3} \l__siunitx_tmp_tl
655       \siunitx_print_unit:V \l__siunitx_tmp_tl
656       \nobreak
657     }
658     \siunitx_quantity:nn {#2} {#4}
659   \group_end:
660 }

```

(End definition for \SI. This function is documented on page ??.)

\SIlist Straight copies.

\SIrange

```

661 \NewDocumentCommand \SIlist
662 { O { } > { \SplitList { ; } } m > { \TrimSpaces } m }
663 {
664   \mode_leave_vertical:
665   \group_begin:
666     \siunitx_unit_options_apply:n {#3}
667     \keys_set:nn { siunitx } {#1}
668     \siunitx_quantity_list:nn {#2} {#3}
669   \group_end:
670 }
671 \NewDocumentCommand \SIrange { O { } m m > { \TrimSpaces } m }

```

```

672 {
673   \mode_leave_vertical:
674   \group_begin:
675     \siunitx_unit_options_apply:n {#4}
676     \keys_set:nn { siunitx } {#1}
677     \siunitx_quantity_range:nnn {#2} {#3} {#4}
678   \group_end:
679 }

```

(End definition for \SIlist and \SIrange. These functions are documented on page ??.)

1.12 Symbol commands

```

680 <@@=siunitx_emulation>

```

_siunitx_emulation_non_latin:n
_siunitx_emulation_non_latin:nnnn

As in siunitx-unit, but internal in both cases as it's rather specialised.

```

681 \bool_lazy_or:nnTF
682 { \sys_if_engine luatex_p: }
683 { \sys_if_engine xetex_p: }
684 {
685   \cs_new:Npn \_siunitx_emulation_non_latin:n #1
686     { \char_generate:nn {#1} { \char_value_catcode:n {#1} } }
687 }
688 {
689   \cs_new:Npn \_siunitx_emulation_non_latin:n #1
690     {
691       \exp_last_unbraced:Nf \_siunitx_emulation_non_latin:nnnn
692       { \char_to_utfviii_bytes:n {#1} }
693     }
694   \cs_new:Npn \_siunitx_emulation_non_latin:nnnn #1#2#3#4
695     {
696       \exp_after:wN \exp_after:wN \exp_after:wN
697       \exp_not:N \char_generate:nn {#1} { 13 }
698       \exp_after:wN \exp_after:wN \exp_after:wN
699       \exp_not:N \char_generate:nn {#2} { 13 }
700     }
701 }

```

(End definition for _siunitx_emulation_non_latin:n and _siunitx_emulation_non_latin:nnnn.)
